Part No. HD-95952-33B Connecting Rod Clamping Tool

Part No. HD-34623C Piston Pin Retaining Ring Installer/Remover

Part No. HD-95970-32D Piston Pin Bushing Tool

Part No. HD-42322 Piston Support Plate

Part No. HD-94800-26A Connecting Rod Bushing Reamers and Pilots
Part No. HD-35102 Wrist Pin Bushing Hone (20 mm)

Part No. HD-95760-69A Bushing/Bearing Puller Tool Set. Set includes items 1-7. Items 8 (HD-95769-69), 9 (HD-95770-69) and 10 (HD-95771-69) are optional.

Part No. HD-38515-A Clutch Spring Compressing Tool and Part No. HD-38515-91 Forcing Screw

Part No. HD-97292-61 Two Claw Puller

Part No. HD-39965 Deutsch Terminal Crimp Tool

Part No. J-5586 Transmission Shaft Retaining Ring Pliers

Part No. HD-38515 Transmission Shaft Retaining Ring Pliers

Part No. HD-41354 Speedometer Tester

Part No. HD-41609 Amp Terminal Crimp Tool
REMOVING SOCKET/PIN TERMINALS

1. Remove connector from the retaining device, either attachment or rosebud clip.
2. Depress the button on the socket terminal side of the connector (plug) and pull apart the pin and socket halves.
3. Bend back the latch slightly and free one side of secondary lock, then repeat the step to release the other side. Rotate the secondary lock outward on hinge to access terminals in chambers of connector housing.
4. Looking in the terminal side of the connector (opposite the secondary lock), take note of the cavity next to each terminal.
5. See Figure B-1. With the flat edge against the terminal, insert the pick tool (Snap-On TT600-3) into the cavity until it stops. Pivot the end of the pick away from the terminal (locktab is inside housing) and gently tug on wire to pull terminal from chamber. Do not tug on the wire until the tang is released or the terminal will be difficult to remove. A “click” is heard if the tang is engaged but then inadvertently released. Repeat the step without releasing the tang.

NOTE

- If pick tool is not available, a push pin/safety pin may be used instead.
- An ELECTRICAL TERMINAL CRIMP TOOL (Part No. HD-41609) is used to install Amp Multi lock pin and socket terminals on wires. If new terminals must be installed, see Crimping Instructions on the next page.

INSTALLING SOCKET/PIN TERMINALS

NOTE

For wire location purposes, numbers are stamped into the secondary locks of both the socket and pin housings. See Figure B-2.

1. From the secondary lock side of the connector, insert the terminal into its respective numbered chamber until it snaps in place. For proper fit, the slot in the terminal must face the tang in the chamber.
See Figure B-3. The tang in the chamber engages the slot to lock the terminal in position.

On the pin side of the connector, tangs are positioned at the bottom of each chamber, so the slot in the pin terminal (on the side opposite the crimp tails) must face downward.

On the socket side, tangs are at the top of each chamber, so the socket terminal slot (on the same side as the crimp tails) must face upward.

Up and down can be determined by the position of the release button (used to separate the pin and socket halves). Consider the button to always be on top of the connector.

2. Gently tug on wire end to verify that the terminal is locked in place and will not back out of chamber.  
3. Rotate the hinged secondary lock inward until tabs fully engage latches on both sides of connector.  
4. Insert the socket housing (plug) into the pin housing (receptacle) until it snaps in place.  
5. Install connector on retaining device, either attachment or rosebud clip.

Figure B-2. Release Tang and Back Out Terminals

Figure B-3. Multilock Connector Cutaway View
Figure B-4. 3-Place and 6-Place Amp Multilock Connectors

Secondary locks open (socket housings shown)

Stamped numbers on secondary locks indicate wire color locations
CRIMPING INSTRUCTIONS

1. Squeeze the handles to cycle the crimp tool (Part No. HD-41609) to the fully open position.

2. Raise locking bar by pushing up on bottom flange. With the crimp tails facing upward, insert contact (socket/pin) through locking bar, so that the closed side of the contact rests on the front nest (concave split level area of the crimp tool). See Figure B-3.

3. Release locking bar to lock position of contact. When correctly positioned, the locking bar fits snugly in the space at the front of the core crimp tails.

4. Strip lead removing 5/32 in. (4 mm) of insulation. Insert wires between crimp tails until ends make contact with locking bar. Verify that wire is positioned so that short pair of crimp tails squeeze bare wire strands, while long pair folds over insulation material.

5. Squeeze handle of crimp tool until tightly closed. Tool automatically opens when the crimping sequence is complete. Raise up locking bar and remove contact.

6. Inspect the quality of the core and insulation crimps. Distortion should be minimal.

GENERAL

Deutsch Connectors feature a superior seal to protect electrical contacts from dirt and moisture in harsh environments. The connector also provides superior pin retention.

See Figure B-8. This 12-pin connector illustrates the various parts of the Deutsch connector. The following instructions may be followed for all 2-pin through 12-pin Deutsch connectors.

**Socket housing:** alignment tabs and/or external latch, secondary locking wedge, internal seal, wire seal, seal pin.

**NOTE**

*Seal pins or plugs are installed in the wire seals of unused pin and socket locations. If removed, seal pins must be replaced to maintain the integrity of the environmental seal.*

**Pin housing:** alignment grooves and/or external latch cover, attachment clip, secondary locking wedge, wire seal, seal pin.

REMOVING/DISASSEMBLING

Attachment clips are attached to the pin housings of most connectors. The clips are then attached to T-studs on the motorcycle frame. T-studs give positive location to electrical connectors and wire harness. Consistent location reduces electrical problems and improves serviceability.

1. Push the connector to disengage small end of slot on attachment clip from T-stud. Lift connector off T-stud.

2. Depress the external latch(es) on the socket housing side and use a rocking motion to separate the pin and socket halves. Two-, three-, four- and six-pin Deutsch connectors have one external latch, while eight- and twelve-pin connectors have two, both of which must be pressed simultaneously to separate the connector halves.

**NOTE**

*With few exceptions, the socket housing can always be found on the accessory side, while the pin side of the connector is connected to the wiring harness.*

REMOVING/INSTALLING SOCKETS

1. See Figure B-7. Remove the secondary locking wedge. Insert the blade of a small screwdriver between the socket housing and locking wedge inline with the groove (inline with the pin holes if the groove is absent). Turn the screwdriver 90 degrees to pop the wedge up.

2. See Figure B-8. Gently depress terminal latches inside socket housing and back out sockets through holes in rear wire seal.

**NOTE**

*An ELECTRICAL TERMINAL CRIMP TOOL (Part No. HD-39965) is used to install Deutsch pin and socket terminals on wires. If new terminals must be installed, follow the instructions included with the crimping tool or see Crimping Instructions in this section.*

Fit rear wire seal into back of socket housing, if removed. Grasp socket approximately 1.0 in. (25.4 mm) behind the contact barrel. Gently push sockets through holes in wire seal into their respective chambers. Feed socket into chamber until it “clicks” in place. Verify that socket will not back out of chamber; a slight tug on the wire will confirm that it is properly locked in place.
3. Install internal seal on lip of socket housing, if removed. Insert tapered end of secondary locking wedge into socket housing and press down until it snaps in place. The wedge fits into the center groove within the socket housing and holds the terminal latches tightly closed.

NOTES
● While rectangular wedges do not require a special orientation, the conical secondary locking wedge of the 3-pin connector must be installed with the arrow pointing toward the external latch. See Figure B-9.
● If the secondary locking wedge does not slide into the installed position easily, verify that all terminals are fully installed in the socket housing. The lock indicates when terminals are not properly installed by not entering its fully installed position.

REMOVING/INSTALLING PINS

1. Remove the secondary locking wedge. Use the hooked end of a stiff piece of mechanics wire, a needle nose pliers, or a suitable pick tool (Part No. HD-41475-100). See Figure B-10.

2. Gently depress terminal latches inside pin housing and back out pins through holes in wire seal.
NOTE
An ELECTRICAL TERMINAL CRIMP TOOL (Part No. HD-39965) is used to install Deutsch pin and socket terminals on wires. If new terminals must be installed, see Crimping Instructions in this section.

3. Fit wire seal into back of pin housing. Grasp crimped pin approximately 1.0 in. (25.4 mm) behind the contact barrel. Gently push pins through holes in wire seal into their respective numbered locations. Feed pin into chamber until it “clicks” in place. Verify that pin will not back out of chamber; a slight tug on the wire will confirm that it is properly locked in place.

4. Insert tapered end of secondary locking wedge into pin housing and press down until it snaps in place. The wedge fits in the center groove within the pin housing and holds the terminal latches tightly closed.

NOTES
- While rectangular wedges do not require a special orientation, the conical secondary locking wedge of the 3-pin connector must be installed with the arrow pointing toward the external latch. See Figure B-9.
- If the secondary locking wedge does not slide into the installed position easily, verify that all terminals are fully installed in the pin housing. The lock indicates when terminals are not properly installed by not entering its fully installed position.

ASSEMBLING/INSTALLING

1. Insert socket housing into pin housing until it snaps in place. Two-, three-, four- and six-pin Deutsch connectors have one external latch on the socket half of the connector. To fit the halves of the connector together, the latch on the socket side must be aligned with the latch cover on the pin side.

For those connectors with two external latches (8-pin and 12-pin), a different system is used to prevent improper assembly. Align the tabs on the socket housing with the grooves on the pin housing. Push the connector halves together until the latches “click.” If latches do not click (latch), press on one side of the connector until that latch engages, then press on the opposite side to engage the other latch.

NOTE
Deutsch connectors are color coded for location purposes. Those connectors associated with left side accessories, such as the front and rear left turn signals, are gray. All other connectors, including those associated with right side accessories, are black.

If it should become necessary to replace a plug or receptacle, please note that the 8-pin and 12-pin gray and black connectors are not interchangeable. Since location of the alignment tabs differ between the black and gray connectors, plugs or receptacles must be replaced by those of the same color. If replacing both the socket and pin halves, then the black may be substituted for the gray, and vice versa. The socket and pin halves of all other connectors are interchangeable, that is, the black may be mated with the gray, since the alignment tabs are absent and the orientation of the external latch is the same.

2. See Figure B-11. Fit the attachment clip to the pin housing, if removed. Place large end of slot on attachment clip over T-stud on frame. Push assembly forward to engage small end of slot.
CRIMPING INSTRUCTIONS

1. See Figure B-12. Squeeze the handles to cycle the crimp tool to the fully open position.

2. Raise locking bar by pushing up on bottom flange. With the crimp tails facing upward and the rounded side of the contact barrel resting on the concave split level area of the crimp tool, insert contact (socket/pin) through middle hole of locking bar.

3. Release locking bar to lock position of contact. If the crimp tails are slightly out of vertical alignment, the crimp tool automatically rotates the contact so that the tails face straight upward. When correctly positioned, the locking bar fits snugly in the space between the contact band and the core crimp tails.

4. Strip lead removing 5/32 in. (4 mm) of insulation. Insert wires between crimp tails until ends make contact with locking bar. Verify that wire is positioned so that short pair of crimp tails squeeze bare wire strands, while long pair folds over insulation material.

5. Squeeze handle of crimp tool until tightly closed. Tool automatically opens when the crimping sequence is complete. Raise up locking bar and remove contact.

6. Inspect the quality of the core and insulation crimps. Distortion should be minimal.

2003 Buell XB9S: Appendix B   B-9
From a servicing standpoint, there are two basic types of Packard electrical connectors, those with pull-to-seat terminals and those with push-to-seat terminals.

Look into the mating end of the connector. If it appears that the terminal can be extracted from this side, then it is probably the pull-to-seat type.

At least one Packard pull-to-seat terminal can be easily recognized by the presence of a locking ear. The ear engages a slot in the connector housing and prevents the terminal from being removed from the wire end side of the connector. The ear also acts as a strain relief in the event that the wires are pulled and further inhibits movement of the terminal inside the chamber. For an example of this type of connector, note the MAP sensor connector [80].

Unlike most connectors, where the terminals are pulled out the wire end of the connector, to remove the terminals from the pull-to-seat connectors, the terminal is pushed out the mating end of the connector. Once a new terminal is crimped onto the end of the wire, the wire is pulled to draw the terminal back inside the chamber of the connector housing.

Two types of Packard pull-to-seat electrical connectors are used. One type has an external latch to lock the pin and socket halves together, while the other makes use of a wire-form. See Figure B-14. The manner in which the terminals are picked differs between these two types of connectors, as further described below.

**Figure B-14. Packard Connectors**

A. Locate tang on latch side of chamber.

B. Pivot end of pin to depress tang.

C. Push on wire end of lead to remove terminal.

D. Raise tang and re-install terminal.
Removing External Latch Type

To remove a pull-to-seat terminal from connectors with external latches, proceed as follows:

1. Remove the connector from the retaining device, if present.
2. Bend back the external latch(es) slightly and separate the pin and socket halves of the connector.
3. To free a pull-to-seat terminal from the connector housing, first look into the mating end of the connector to find the locking tang. See A in Figure B-14. The tangs are always positioned in the middle of the chamber and are on the same side as the external latch. On those connectors with locking ears, the tang is on the side opposite the ear.
4. At a slight angle, gently insert the point of a one inch safety pin down the middle of the chamber (about 1/8 inch) and pivot the end of the pin toward the terminal body. When a click is heard, remove the pin and repeat the procedure. See B in Figure B-14. The click is the sound of the tang returning to the locked position as it slips from the point of the pin. Pick at the tang in this manner until the clicking stops and the pin seems to slide in at a slightly greater depth than it had previously. This is an indication that the tang has been depressed.

   NOTES

- On those terminals that have been extracted on a previous occasion, no clicking sound may be heard when the pin is pivoted to depress the tang, but proceed as if the clicking is audible and then push on the wire end of the lead to check if the terminal is free.
- When picking multiple terminals, the end of the pin may become malleable. For best results, continue the procedure with a new safety pin.
5. Remove the pin and push on the wire end of the lead to extract the terminal from the mating end of the connector. See C in Figure B-14. If necessary, pull back the conduit and remove the wire seal at the back of the connector to introduce some slack in the wires.

   NOTE

A series of Packard Electrical Terminal Crimp Tools are available to install Packard pin and socket terminals on wires. If new terminals must be installed, see Crimping Instructions.
PUSH-TO-SEAT TERMINALS

The Packard push-to-seat terminal connectors found on Softail model vehicles are listed below.

- Ignition Switch [33]
- Fuse Terminals
- MAP Sensor [80]

Removing Push-to-Seat Terminals

Like most connectors, Packard push-to-seat terminals are pulled out the wire end of the connector. To remove a push-to-seat terminal, proceed as follows:

1. Remove the connector from the retaining device, if present.
2. Bend back the external latch(es) slightly and separate the pin and socket halves of the connector.
3. Open or remove the secondary lock. Bend back the latch slightly and free one side of the secondary lock, then repeat the step to release the other side. Rotate the secondary lock outward on hinge to access the terminals in the chambers of the connector housing.
4. Looking in the mating end or terminal side of the connector (opposite the secondary lock), take note of the larger cavity next to each terminal.
5. Insert the pick (Snap-On TT600-3) into the cavity until it stops. Pivot the end of the pick toward the terminal to depress the locking tang. Remove the pick and gently tug on the wire to pull the terminal from the wire end of the connector. Repeat the step if the terminal is still locked in place.

NOTE
Both the Ignition Light/Key Switch and the Main Power connectors are provided with secondary locks. The secondary lock, which may be molded onto the connector or exist as a separate piece, aids in terminal retention. Secondary locks must be opened (or removed) before the terminals can be extracted from the connector housing.

Installing Push-to-Seat Terminals

NOTE
For wire location purposes, alpha characters are stamped onto the secondary locks or onto the wire end of the connector housing.

1. To install a terminal back into the chamber of the connector housing, use a thin flat blade, like that on an X-Acto knife, and carefully bend the tang outward away from the terminal body.
2. Push the lead into the chamber at the wire end of the connector. A click is heard when the terminal is properly seated.
3. Gently tug on the wire end to verify that the terminal is locked in place and will not back out of the chamber.
4. Close or install the secondary lock. Rotate the hinged secondary lock inward until tabs fully engage latches on both sides of connector.
5. Push the pin and socket halves of the connector together until the latches “click.”
6. Install connector on retaining device, if present.

NOTE
A series of Packard Electrical Terminal Crimp Tools are available to install Packard pin and socket terminals on wires. If new terminals must be installed, see Crimping Instructions.
CRIMPING INSTRUCTIONS

1. Strip wire lead removing 5/32 in. (4 mm) of insulation.

2. Compress handles until ratchet automatically opens.

   NOTE
   Always perform core crimp before insulation/seal crimp.

3. See Table B-1. Determine the correct dye or nest for the core crimp.

   NOTE
   When the word “TIP” appears in the Crimp Table, use the tip of the tool specified to perform the core crimp procedure. See Figure B-15.

4. Lay the back of the core crimp tails on the appropriate nest. Be sure the core crimp tails are pointing towards the forming jaws.

5. Gently apply pressure to handles of tool until crimpers slightly secure the core crimp tails.

6. Insert stripped wire between crimp tails. Verify that wire is positioned so that short pair of crimp tails squeeze bare wire strands, while long pair folds over insulation or seal material.

7. Squeeze handle of crimp tool until tightly closed. Tool automatically opens when the crimping sequence is complete.

8. Table B-1. Determine the correct dye or nest for the insulation/seal crimp.

9. Lay the back of the insulation/seal crimp tails on the appropriate nest. Be sure the insulation/seal crimp tails are pointing towards the forming jaws.

10. Squeeze handle of crimp tool until tightly closed. Tool automatically opens when the crimping sequence is complete.

11. See Figure B-16. Inspect the quality of the core (3) and insulation/seal (2) crimps. Distortion should be minimal.

2003 Buell XB9S: Appendix C

C-1


GENERAL

Torque specifications for specific components are listed in each section at the point of use. When converting to Newton-meters, use the formulas given under the metric chart. For all other steel fasteners, use the values listed in one of the tables below. In the English table, torque figures are listed in ft-lbs, except those marked with an asterisk (*), which are listed in in-lbs. In the metric table, figures are listed in Newton-meters.

- foot-pounds (ft-lbs) x 1.356 = Newton-meters (Nm)
- inch-pounds (in-lbs) x 0.113 = Newton-meters (Nm)

WARNING

The quality fasteners used on Harley-Davidson motorcycles have specific strength, finish and type requirements to perform properly in the assembly and the operating environment. Use only genuine Harley replacement fasteners tightened to the proper torque. Substitution could cause fastener failure, which could result in death or serious injury.

</tr>
</tbody>
</table>

Use SAE 2, 5 and 8 values when grade is known, with nut of sufficient strength.

foot-pounds (ft-lbs) x 1.356 = Newton-meters (Nm)
inch-pounds (in-lbs) x 0.113 = Newton-meters (Nm)
UNITED STATES SYSTEM

Unless otherwise specified, all fluid volume measurements in this Service Manual are expressed in United States (U.S.) units-of-measure. See below:

- 1 pint (U.S.) = 16 fluid ounces (U.S.)
- 1 quart (U.S.) = 2 pints (U.S.) = 32 fl. oz. (U.S.)
- 1 gallon (U.S.) = 4 quarts (U.S.) = 128 fl. oz. (U.S.)

METRIC SYSTEM

Fluid volume measurements in this Service Manual include the metric system equivalents. In the metric system, 1 liter (L) = 1,000 milliliters (mL). Should you need to convert from U.S. units-of-measure to metric units-of-measure (or vice versa), refer to the following:

- fluid ounces (U.S.) x 29.574 = milliliters
- pints (U.S.) x 0.473 = liters
- quarts (U.S.) x 0.946 = liters
- gallons (U.S.) x 3.785 = liters
- milliliters x 0.0338 = fluid ounces (U.S.)
- liters x 2.113 = pints (U.S.)
- liters x 1.057 = quarts (U.S.)
- liters x 0.264 = gallons (U.S.)

BRITISH IMPERIAL SYSTEM

Fluid volume measurements in this Service Manual do not include the British Imperial (Imp.) system equivalents. The following conversions exist in the British Imperial system:

- 1 pint (Imp.) = 20 fluid ounces (Imp.)
- 1 quart (Imp.) = 2 pints (Imp.)
- 1 gallon (Imp.) = 4 quarts (Imp.)

Although the same unit-of-measure terminology as the U.S. system is used in the British Imperial (Imp.) system, the actual volume of each British Imperial unit-of-measure differs from its U.S. counterpart. The U.S. fluid ounce is larger than the British Imperial fluid ounce. However, the U.S. pint, quart, and gallon are smaller than the British Imperial pint, quart, and gallon, respectively. Should you need to convert from U.S. units to British Imperial units (or vice versa), refer to the following:

- fluid ounces (U.S.) x 1.042 = fluid ounces (Imp.)
- pints (U.S.) x 0.833 = pints (Imp.)
- quarts (U.S.) x 0.833 = quarts (Imp.)
- gallons (U.S.) x 0.833 = gallons (Imp.)
- fluid ounces (Imp.) x 0.960 = fluid ounces (U.S.)
- pints (Imp.) x 1.201 = pints (U.S.)
- quarts (Imp.) x 1.201 = quarts (U.S.)
- gallons (Imp.) x 1.201 = gallons (U.S.)

SERVICING A NEW
MOTORCYCLE

WARNING
Always follow the listed service and maintenance recommendations, because they affect the safe operation of the motorcycle and the personal welfare of the rider. Failure to follow recommendations could result in death or serious injury.

Service operations to be performed before customer delivery are specified in the applicable model year PREDELIVERY AND SETUP MANUAL.

The performance of new motorcycle initial service is required to keep warranty in force and to ensure proper emissions systems operation. See 1.3 MAINTENANCE SCHEDULE for details.

SAFE OPERATING
MAINTENANCE

CAUTION

● Do not attempt to retighten engine head bolts. Retightening can cause engine damage.

● During the initial break-in period, use only Harley-Davidson 20W50 engine oil. Failure to use the recommended oil will result in improper break-in of the engine cylinders and piston rings.

A careful check of certain equipment is necessary after periods of storage, and frequently between regular service intervals, to determine if additional maintenance is required.

Check:

1. Tires for abrasions, cuts and correct pressure.
2. Secondary drive belt for proper tension and condition.
3. Brakes, steering and throttle for responsiveness.
4. Brake fluid level and condition. Hydraulic lines and fittings for leaks. Also, check brake pads and rotors for wear.
5. Cables for fraying, crimping and free operation.
6. Engine oil and transmission fluid levels.
7. Headlamp, passing lamp, tail lamp, brake lamp and turn signal operation.

SHOP PRACTICES

Repair Notes

NOTE

● General maintenance practices are given in this section.
● Repair = Disassembly/Assembly.
● Replace = Removal/Installation.

All special tools and torque values are noted at the point of use.

All required parts or materials can be found in the appropriate PARTS CATALOG.

Safety

Safety is always the most important consideration when performing any job. Be sure you have a complete understanding of the task to be performed. Use common sense. Use the proper tools. Protect yourself and bystanders with approved eye protection. Don’t just do the job – do the job safely.

Removing Parts

Always consider the weight of a part when lifting. Use a hoist whenever necessary. Do not lift heavy parts by hand. A hoist and adjustable lifting beam or sling are needed to remove some parts. The lengths of chains or cables from the hoist to the part should be equal and parallel and should be positioned directly over the center of the part. Be sure that no obstructions will interfere with the lifting operation. Never leave a part suspended in mid-air.

WARNING

Always check the capacity rating and condition of hoists, slings, chains or cables before use. Failure to do so can lead to an accident which could result in death or serious injury.

Always use blocking or proper stands to support the part that has been hoisted. If a part cannot be removed, verify that all bolts and attaching hardware have been removed. Check to see if any parts are in the way of the part being removed.

When removing hoses, wiring or tubes, always tag each part to ensure proper installation.

Cleaning

If you intend to reuse parts, follow good shop practice and thoroughly clean the parts before assembly. Keep all dirt out of parts; the unit will perform better and last longer. Seals, filters and covers are used in this vehicle to keep out environmental dirt and dust. These items must be kept in good condition to ensure satisfactory operation.

Clean and inspect all parts as they are removed. Be sure all holes and passages are clean and open. After cleaning, cover all parts with clean lint-free cloth, paper or other material. Be sure the part is clean when it is installed.

Always clean around lines or covers before they are removed. Plug, tape or cap holes and openings to keep out dirt, dust and debris.
Disassembly and Assembly

Always assemble or disassemble one part at a time. Do not work on two assemblies simultaneously. Be sure to make all necessary adjustments. Recheck your work when finished. Be sure that everything is done.

Operate the vehicle to perform any final check or adjustments. If all is correct, the vehicle is ready to go back to the customer.

REPAIR AND REPLACEMENT PROCEDURES

Hardware and Threaded Parts

Install helical thread inserts when inside threads in castings are stripped, damaged or not capable of withstanding specified torque.

Replace bolts, nuts, studs, washers, spacers and small common hardware if missing or in any way damaged. Clean up or repair minor thread damage with a suitable thread chaser.

Replace all damaged or missing lubrication fittings.

Use Teflon pipe sealant on pipe fitting threads.

Wiring, Hoses and Lines

Replace hoses, clamps, electrical wiring, electrical switches or fuel lines if they do not meet specifications.

Instruments and Gauges

Replace broken or defective instruments and gauges. Replace dials and glass that are so scratched or discolored that reading is difficult.

Bearings

Anti-friction bearings must be handled in a special way. To keep out dirt and abrasives, cover the bearings as soon as they are removed from the package.

Wash bearings in a non-flammable cleaning solution. Knock out packed lubricant inside by tapping the bearing against a wooden block. Wash bearings again. Cover bearings with clean material after setting them down to dry. Never use compressed air to dry bearings.

Coat bearings with clean oil. Wrap bearings in clean paper.

Be sure that the chamfered side of the bearing always faces the shoulder (when bearings installed against shoulders). Lubricate bearings and all metal contact surfaces before pressing into place. Only apply pressure on the part of the bearing that makes direct contact with the mating part. Install bearings with numbered side facing out.

Always use the proper tools and fixtures for removing and installing bearings.

Bearings do not usually need to be removed. Only remove bearings if necessary.

Bushings

Do not remove a bushing unless damaged, excessively worn or loose in its bore. Press out bushings that must be replaced.

When pressing or driving bushings, be sure to apply pressure in line with the bushing bore. Use a bearing/bushing driver or a bar with a smooth, flat end. Never use a hammer to drive bushings.

Inspect the bushing and the mated part for oil holes. Be sure all oil holes are properly aligned.

Gaskets

Always discard gaskets after removal. Replace with new gaskets. Never use the same gasket twice. Be sure that gasket holes match up with holes in the mating part.

Lip Type Seals

Lip seals are used to seal oil or grease and are usually installed with the sealing lip facing the contained lubricant. Seal orientation, however, may vary under different applications.

Seals should not be removed unless necessary. Only remove seals if required to gain access to other parts or if seal damage or wear dictates replacement.

Leaking oil or grease usually means that a seal is damaged. Replace leaking seals to prevent overheated bearings.

Always discard seals after removal. Do not use the same seal twice.

O-Rings (Preformed Packings)

Always discard O-rings after removal. Replace with new O-rings. To prevent leaks, lubricate the O-rings before installation. Apply the same type of lubricant as that being sealed. Be sure that all gasket, O-ring and seal mating surfaces are thoroughly clean before installation.

Gears

Always check gears for damaged or worn teeth.

Lubricate mating surfaces before pressing gears on shafts.

Shafts

If a shaft does not come out easily, check that all nuts, bolts or retaining rings have been removed. Check to see if other parts are in the way before using force.

Shafts fitted to tapered splines should be very tight. If shafts are not tight, disassemble and inspect tapered splines. Discard parts that are worn. Be sure tapered splines are clean, dry and free of burrs before putting them in place. Press mating parts together tightly.

Clean all rust from the machined surfaces of new parts.

Part Replacement

Always replace worn or damaged parts with new parts.
HOME

CLEANING

Part Protection
Before cleaning, protect rubber parts (such as hoses, boots and electrical insulation) from cleaning solutions. Use a grease-proof barrier material. Remove the rubber part if it cannot be properly protected.

Cleaning Process
Any cleaning method may be used as long as it does not result in parts damage. Thorough cleaning is necessary for proper parts inspection. Strip rusted paint areas to bare metal before repainting.

Rust or Corrosion Removal
Remove rust and corrosion with a wire brush, abrasive cloth, sand blasting, vapor blasting or rust remover. Use buffing crocus cloth on highly polished parts that are rusted.

TOOL SAFETY

Air Tools
- Always use approved eye protection equipment when performing any task using air-operated tools.
- On all power tools, use only recommended accessories with proper capacity ratings.
- Do not exceed air pressure ratings of any power tools.
- Bits should be placed against work surface before air hammers are operated.
- Disconnect the air supply line to an air hammer before attaching a bit.
- Never point an air tool at yourself or another person.
- Protect bystanders with approved eye protection.

Wrenches
- Never use an extension on a wrench handle.
- If possible, always pull on a wrench handle and adjust your stance to prevent a fall if something lets go.
- Never cock a wrench.
- Never use a hammer on any wrench other than a STRIKING FACE wrench.
- Discard any wrench with broken or battered points.
- Never use a pipe wrench to bend, raise or lift a pipe.

Pliers/cutters/prybars
- Plastic- or vinyl-covered pliers handles are not intended to act as insulation; don’t use on live electrical circuits.
- Don’t use pliers or cutters for cutting hardened wire unless they were designed for that purpose.
- Always cut at right angles.
- Don’t use any prybar as a chisel, punch or hammer.

Hammers
- Never strike one hammer against a hardened object, such as another hammer.
- Always grasp a hammer handle firmly, close to the end.
- Strike the object with the full face of the hammer.
- Never work with a hammer which has a loose head.
- Discard hammer if face is chipped or mushroomed.
- Wear approved eye protection when using striking tools.
- Protect bystanders with approved eye protection.

Punches/chisels
- Never use a punch or chisel with a chipped or mushroomed end; dress mushroomed chisels and punches with a file.
- Hold a chisel or a punch with a tool holder if possible.
- When using a chisel on a small piece, clamp the piece firmly in a vise and chip toward the stationary jaw.
- Wear approved eye protection when using these tools.
- Protect bystanders with approved eye protection.

Screwdrivers
- Don’t use a screwdriver for prying, punching, chiseling, scoring or scraping.
- Use the right type of screwdriver for the job; match the tip to the fastener.
- Don’t interchange POZIDRIV®, PHILLIPS® or REED AND PRINCE screwdrivers.
- Screwdriver handles are not intended to act as insulation; don’t use on live electrical circuits.
- Don’t use a screwdriver with rounded edges because it will slip – redress with a file.

Ratchets and Handles
- Periodically clean and lubricate ratchet mechanisms with a light grade oil. Do not replace parts individually; ratchets should be rebuilt with the entire contents of service kit.
- Never hammer or put a pipe extension on a ratchet or handle for added leverage.
- Always support the ratchet head when using socket extensions, but do not put your hand on the head or you may interfere with the action of its reversing mechanism.
- When breaking loose a fastener, apply a small amount of pressure as a test to be sure the ratchet’s gear wheel is engaged with the pawl.
Sockets

- Never use hand sockets on power or impact wrenches.
- Select the right size socket for the job.
- Never cock any wrench or socket.
- Select only impact sockets for use with air or electric impact wrenches.
- Replace sockets showing cracks or wear.
- Keep sockets clean.
- Always use approved eye protection when using power or impact sockets.

Storage Units

- Don’t open more than one loaded drawer at a time. Close each drawer before opening up another.
- Close lids and lock drawers and doors before moving storage units.
- Don’t pull on a tool cabinet; push it in front of you.
- Set the brakes on the locking casters after the cabinet has been rolled to your work.
**FUEL**

**WARNING**

Remove filler cap slowly and fill fuel tank slowly to prevent spillage; do not overfill or fill above the bottom of the filler neck insert. In addition, leave air space to allow for fuel expansion. Expansion can cause an overfilled tank to overflow gasoline through the filler cap onto surrounding areas. After refueling, be sure filler cap is securely tightened. Failure to comply may cause an explosion or fire which could result in death or serious injury.

Use a good quality leaded or unleaded gasoline (91 pump octane or higher). Pump octane is the octane number usually shown on the gas pump.

**GASOLINE BLENDS**

**CAUTION**

Using gasoline that has an alcohol additive, such as methanol, may cause fuel system rubber components’ failure and/or engine damage.

Harley-Davidson motorcycles were designed to give the best performance using unleaded gasoline. Some fuel suppliers sell gasoline/alcohol blends as a fuel. The type and amount of alcohol added to the fuel is important.

- **DO NOT USE GASOLINES CONTAINING METHANOL.** Using gasoline/methanol blends will result in starting and driveability deterioration and damage to critical fuel system components.

- **ETHANOL** is a mixture of 10% ethanol (Grain alcohol) and 90% unleaded gasoline. Gasoline/ethanol blends can be used in your motorcycle if the ethanol content does not exceed 10%.

- **REFORMULATED OR OXYGENATED GASOLINES (RFG):** “Reformulated gasoline” is a term used to describe gasoline blends that are specifically designed to burn cleaner than other types of gasoline. Your motorcycle will run normally using this type of gas.

You may find that some gasoline blends adversely affect the starting, driveability or fuel efficiency of your bike. If you experience one or more of these problems, we recommend you try a different brand of gasoline or gasoline with a higher octane rating.

**ENGINE OIL**

Use the proper grade of oil for the lowest temperature expected before the next oil change.

If it is necessary to add oil and Harley-Davidson oil is not available, use an oil certified for diesel engines. Acceptable diesel engine oil designations include CF, CF-4, CG-4 and CH-4. The preferred viscosities for the diesel engine oils, in descending order, are 20W-50, 15W-40 and 10W-40. At the first opportunity, see a Harley-Davidson dealer to change back to 100 percent Harley-Davidson oil.

See **1.6 ENGINE LUBRICATION SYSTEM** for all service information.

**WINTER LUBRICATION**

Combustion in an engine produces water vapor. During starting and warm-up in cold weather, especially in freezing temperatures, the vapor condenses to water before the crankcase is hot enough to exhaust it through the breather system. If the engine is run long enough for the crankcase to become thoroughly heated, the water returns to vapor and is then exhausted.

An engine used for only short trips, and seldom allowed to thoroughly warm up, accumulates increasing amounts of water in the oil pan. Water mixed with oil forms a sludge that causes accelerated engine wear. In freezing temperatures, the water becomes slush or ice, which may clog oil lines and result in engine failure.

Always change the engine oil more often in winter. If the engine is used for short runs, change the oil even more frequently. The farther below freezing the temperature drops the more often the oil should be changed.

**Chart Codes:**
- \(1\): Inspect, & if necessary correct, clean or replace.
- \(2\): Replace or change.
- \(3\): Adjust.
- \(4\): Disassemble (lube & inspect).
- \(5\): Lubricate with specified lubricant.
- \(6\): Tighten to proper torque.
- \(7\): Perform.
GENERAL

Special care and maintenance are required for the molded-in-color body panels that are standard on your Buell motorcycle.

Molded-in-color surfaces look like painted surfaces, but are not. The color pigment is mixed in with the material when the part is made, not applied over the surface. Molded-in-color panels require different maintenance than painted surfaces to maintain their original shine. Using methods that work on painted surfaces may ruin the finish of molded-in-color parts.

CAUTION

Use of abrasive products or powered buffing equipment will cause permanent cosmetic damage to molded-in-color body panels. Use only the recommended products and techniques outlined in this section to avoid damaging molded-in-color body panels.

CAUTION

Do not use touch-up paint on molded-in-color panels.

RECOMMENDED PRODUCTS

Products recommended for the proper care and maintenance of molded-in-color body panels are available at your Buell dealer and are listed below:

- Harley Wash (Part No. 99715-90) or Harley Sun Wash (Part No. 94659-98)
- Harley Gloss (Part No. 94627-98)
- Harley Glaze Polish and Sealant (Part No. 99701-84)
- Harley Swirl and Scratch Treatment (Part No. 94655-98)
- Harley Softcloth (Part No. 94656-98)

CARE AND MAINTENANCE

Washing

To wash molded-in-color panels:

1. Rinse surface with water.
2. Wash with Harley Wash or Harley Sun Wash.
3. Rinse surface thoroughly with water.
4. Dry with a clean chamois or soft dry natural fiber cloth.

Cleaning Between Washings

Untreated molded-in-color body panels sometimes have a static charge that attracts dust. Applying Harley Gloss or Harley Glaze Polish and Sealant to molded-in-color surfaces will eliminate this condition.

To keep a high gloss finish on molded-in-color panels between washings:

1. Spray Harley Gloss onto surface and wipe with a clean soft natural fiber cloth or Harley Softcloth.

   NOTE

   Rain or water will remove Harley Gloss from body panels.

2. Reapply Harley Gloss as described above to keep surfaces looking their best.

Polishing

Polishing molded-in-color body panels results in greater surface gloss and a protective coating.

1. Apply Harley Glaze Polish and Sealant every six months or as required to keep molded-in-color panels protected and looking their best.

   2. Clean and dry surfaces to be polished (see Washing).

   3. Apply Harley Glaze Polish and Sealant to clean, slightly dampened cloth or sponge and apply to surface with a light overlapping motion. Make sure to cover all areas.

   4. Let Harley Glaze Polish and Sealant dry to a haze and buff off residue with a clean soft cloth or Harley Softcloth.

Minor Scratch Removal

To remove minor scratches from body panels:

1. To remove light surface scratches and rubs, use Harley Swirl and Scratch Treatment as recommended.

2. Make sure Swirl and Scratch Treatment is applied with a moist cloth and by hand (not by machine).

3. After scratch or rub has been repaired, polish surface lightly with Harley Glaze.

Major Scratches

There is no repair procedure for severely scratched surfaces. Severely scratched body panels must be replaced.
BATTERY MAINTENANCE

GENERAL

Buell motorcycle batteries are permanently sealed, maintenance-free, valve-regulated, lead/calcium and sulfuric acid batteries. The batteries are shipped pre-charged and ready to be put into service. Do not attempt to open these batteries for any reason.

Inspect the battery for damage or leaks and for clean, non-corroded connections:

- At the 1000 mile (1600 km) service interval.
- At every scheduled service interval thereafter.

WARNING

All batteries contain electrolyte. Electrolyte is a sulfuric acid solution that is highly corrosive and can cause severe chemical burns. Avoid contact with skin, eyes, and clothing. Avoid spillage. Always wear protective face shield, rubberized gloves and protective clothing when working with batteries. A warning label is attached to the top of the battery. See Figure 1-1. Never remove warning label from battery. Failure to read and understand all precautions contained in warning label before performing any service on batteries could result in death or serious injury.

WARNING

Battery posts, terminals and related accessories contain lead and lead components, chemicals known to the State of California to cause cancer and birth defects or other reproductive harm. Wash hands after handling.

BATTERY TESTING

Voltmeter Test

See Table 1-3. The voltmeter test provides a general indicator of battery condition. Check the voltage of the battery to verify that it is in a 100% fully charged condition. If the open circuit (disconnected) voltage reading is below 12.6V, charge the battery and then recheck the voltage after the battery has set for one to two hours. If the voltage reading is 12.8V or above, perform the load test described under 7.10 BATTERY.
BATTERY DISCONNECTION AND REMOVAL

1. Remove seat. See 2.41 SEAT.

WARNING
Always disconnect the negative battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

2. Unthread fastener and remove battery negative cable (black) from battery negative (-) terminal.
3. Pull back terminal cover boot.
4. Unthread fastener and remove battery positive cable (red) from battery positive (+) terminal.
5. Unhook strap and remove battery.

CLEANING AND INSPECTION

1. Battery top must be clean and dry. Dirt and electrolyte on top of the battery can cause battery to self-discharge. Clean battery top with a solution of baking soda (sodium bicarbonate) and water (5 teaspoons baking soda per quart or liter of water). When the solution stops bubbling, rinse off the battery with clean water.
2. Clean cable connectors and battery terminals using a wire brush or sandpaper. Remove any oxidation.
3. Inspect the battery screws, clamps and cables for breakage, loose connections and corrosion. Clean clamps.
4. Check the battery posts for melting or damage caused by overtightening.
5. Inspect the battery for discoloration, raised top or a warped or distorted case, which might indicate that the battery has been frozen, overheated or overcharged.
6. Inspect the battery case for cracks or leaks.

STORAGE

WARNING
Always store batteries where they cannot be reached by children. Contact with the battery’s sulfuric acid could result in death or serious injury.

CAUTION
The electrolyte in a discharged battery will freeze if exposed to freezing temperatures. Freezing may crack the battery case and buckle battery plates.

If the motorcycle will not be operated for several months, such as during the winter season, remove the battery from the motorcycle and fully charge. See 7.10 BATTERY.

See Figure 1-2. Self-discharge is a normal condition and occurs continuously at a rate that depends on the ambient temperature and the battery’s state of charge. Batteries discharge at a faster rate at higher ambient temperatures. To reduce the self-discharge rate, store battery in a cool (not freezing), dry place.

Charge the battery every month if stored at temperatures below 60˚ F. (16˚ C). Charge the battery more frequently if stored in a warm area above 60˚ F. (16˚ C).

NOTE
The H-D Battery Tender Automatic Battery Charger (P/N 99863-93TA) may be used to maintain battery charge for extended periods of time without risk of overcharging or boiling.

When returning a battery to service after storage, fully charge the battery. See 7.10 BATTERY.

Figure 1-2. Battery Self-Discharge Rate
**BATTERY INSTALLATION AND CONNECTION**

1. Place the fully charged battery in the mounting position, terminal side to the rear of motorcycle.
2. Hook rubber strap around body of battery.

**CAUTION**

Connect the cables to the correct battery terminals or damage to the motorcycle electrical system will occur.

**WARNING**

Always connect the positive battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

**CAUTION**

Overtightening fasteners can damage battery terminals.

3. Insert fastener through battery positive cable (red) into threaded hole of battery positive (+) terminal and tighten fastener to 72-96 in-lbs (8-11 Nm).
4. Install terminal cover boot.
5. Insert fastener through battery negative cable (black) into threaded hole of battery negative (-) terminal and tighten fastener to 72-96 in-lbs (8-11 Nm).
6. Apply a light coat of petroleum jelly or corrosion retardant material to both battery terminals.

**WARNING**

After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

7. Install seat. See 2.41 SEAT.
GENERAL

Check engine oil level (hot check) at every refueling stop.

Inspect oil lines and filter for leaks:

- At 1000 mi (1600 km) initial service and every 2500 mi (4000 km) service interval.

Change engine oil and filter under normal service conditions in warm or moderate temperatures:

- At 1000 mi (1600 km) initial service and every 5000 mi (8000 km) service interval thereafter.

- When storing or removing the motorcycle for the season.

Change engine oil and filter under severe service conditions in warm or moderate temperatures (severe dust, temperatures above 80°F/27°C, extensive idling or speeds in excess of 65 mph/105 km/h):

- At 1000 mi (1600 km) initial service and every 2500 mi (4000 km) service interval thereafter.

- When storing or removing the motorcycle for the season.

NOTE

The colder the weather, the shorter the recommended oil change interval. A vehicle used only for short runs in cold weather must have the engine oil drained more frequently.

CHECKING ENGINE OIL LEVEL

An accurate engine oil level reading can only be obtained with the engine at normal operating temperature (hot check). The engine will require a longer warm up period in colder temperatures.

For pre-ride inspection, simply verify that there are no oil leaks from the oil filter and oil lines prior to operating the motorcycle.

- Perform a hot check of the engine oil level at each fuel stop.

CAUTION

Do not allow hot oil level to fall below lower mark on dipstick. To do so may result in equipment damage and/or malfunction.

CAUTION

Do not overfill oil tank. Overfilling oil tank may result in oil carryover to the air cleaner, equipment damage and/or equipment malfunction.

CAUTION

Do not switch oil brands indiscriminately because some oils interact chemically when mixed. Use of inferior oils or non-detergent oils can damage the engine.

Ride motorcycle for approximately 10 minutes to ensure the oil is hot and the engine is at normal operating temperature.

1. The motorcycle must be on level ground, on the side-stand, with the engine off.

2. See Figure 1-3. Unscrew and remove dipstick from oil tank/swingarm filler hole. Wipe dipstick clean.

3. Insert dipstick into oil tank filler hole, screwing dipstick in completely. DO NOT OVER TIGHTEN.

 NOTE

The area between the upper and lower registration marks is the operating range.

4. See Figure 1-5. Unscrew and remove dipstick and note oil level.

   a. Oil level should be within the operating range (between upper and lower registration marks) on dipstick.

   b. If oil level is below lower registration mark, add only enough oil to bring oil level between lower and upper registration marks.
CHANGING ENGINE OIL AND FILTER

Ride motorcycle for approximately 10 minutes to ensure the oil is hot and the engine is at normal operating temperature. Turn engine off.

NOTE
Secure rear wheel on lift or place scissor jack under jacking point.

Draining Oil
1. See Figure 1-4. Place a suitable container under the drain plug.

2. Using a 5/8 in. wrench, remove drain plug from under oil tank/swingarm. Wipe any accumulated debris from magnetic tip on drain plug.

3. See Figure 1-5. Unscrew and remove dipstick from oil fill hole on top of oil tank/swingarm.

Changing Filter
1. Remove chin fairing See 2.34 CHIN FAIRING.

2. See Figure 1-6. Remove oil filter using pliers or belt type OIL FILTER WRENCH.

3. Clean filter gasket contact surface on crankcase. Surface should be smooth and free of any debris or old gasket material.

4. Apply a thin film of clean engine oil to filter gasket.

5. Pour 4.0 ounces (0.12 liter) of clean engine oil into new filter when changing oil (until filter is approximately 1/2 full).

WARNING
Be sure no oil gets on tires when changing oil and filter. Traction will be adversely affected which may lead to loss of control which could result in death or serious injury.
Replacing Oil

1. Inspect drain plug o-ring for tears or damage. Replace if required. Wipe any foreign material from drain plug.

2. Install drain plug and tighten to 29-31 ft-lbs.

3. Fill oil tank through filler (dipstick) hole with recommended oil from Table 1-4. Oil tank capacity with filter change is approximately 2.5 quarts (2.4 liters) and includes the 4.0 ounces (0.12 liter) poured into the filter. Always verify proper hot oil level on dipstick. Do not overfill.

4. Inspect o-ring on dipstick for rips or tears. Replace as required.

   **NOTE**
   For ease of installation, apply a light film of clean engine oil to the dipstick o-ring.

5. Install dipstick into oil tank/swingarm fill hole. Make sure dipstick is installed completely. DO NOT OVERTIGHTEN.

6. Remove left side oil cooler scoop. See 2.36 AIR SCOOPS.

7. Inspect oil cooler fins for debris or damage. Blow out any debris from fins with compressed air from the inside of the cooler outward.

8. Wipe up any spilled oil on muffler.

9. Start engine. Verify that oil pressure signal light on instrument support turns off after a few seconds when engine speed is 1000 RPM or above.

10. Check for oil leaks at oil filter, drain plug, hoses and oil cooler.

11. Install chin spoiler. See 2.34 CHIN FAIRING.

12. Install air scoop 2.36 AIR SCOOPS.

13. Check (hot) oil level. See CHECKING ENGINE OIL LEVEL.

GENERAL

Check brake fluid level and condition:
● At the 1000 mile (1600 km) service interval.
● At every 5000 mile (8000 km) service interval thereafter.
● When storing or removing the motorcycle for the season.

Replace D.O.T. 4 BRAKE FLUID:
● Every 2 years.

Front brake hand lever and rear brake foot pedal must have a firm feel when brakes are applied. If not, bleed system as described.

Inspect front and rear brake lines and replace as required:
● At the 1000 mile (1600 km) service interval.
● At every 2500 miles (4000 km) service interval thereafter.
● Every 4 years.

Inspect caliper and master cylinder seals and replace as required:
● At the 1000 mile (1600 km) service interval.
● At every 2500 miles (4000 km) service interval thereafter.
● Every 2 years.

If determining probable causes of poor brake operation, refer to Table 1-5.

BLEEDING BRAKES

WARNING
Use only fresh, uncontaminated D.O.T. 4 fluid. Cans of fluid that have been opened may have been contaminated by moisture in the air or dirt. Use of contaminated brake fluid may adversely affect braking ability and lead to brake failure which could result in death or serious injury.

WARNING
Use only copper crush banjo washers (See Parts Catalog for Part No.) with D.O.T. 4 brake fluid. Earlier silver banjo washers are not compatible with D.O.T. 4 fluid and will not seal properly over time. Failure to comply may adversely affect braking ability and lead to brake failure which could result in death or serious injury.

WARNING
Clean brake system components using denatured alcohol. Do not use mineral-base cleaning solvents, such as gasoline or paint thinner. Use of mineral-base solvents causes deterioration of rubber parts that continues after assembly. This may result in improper brake operation which could result in death or serious injury.

WARNING
Always test motorcycle brakes at low speed after servicing or bleeding system. To prevent death or serious injury, Buell recommends that all brake repairs be performed by a Buell dealer or other qualified technician.

CAUTION
Cover molded-in-color surfaces and right handlebar switches and use care when removing brake reservoir cover and adding D.O.T. 4 brake fluid. Spilling D.O.T. 4 brake fluid on molded-in-color fluid will result in cosmetic damage. Spilling brake fluid on switches may render them inoperative.

**Bleeding Front Brake**

**NOTE**

Hydraulic brake fluid bladder-type pressure equipment can be used to fill the brake master cylinder through the bleeder valve if master cylinder reservoir cover is removed to prevent pressurization.

1. See Figure 1-7. With motorcycle in upright position, install end of plastic tubing over front caliper bleeder valve; place other end in a clean container.

**CAUTION**

Cover molded-in-color surfaces and right handlebar switches and use care when removing brake reservoir cover and adding D.O.T. 4 brake fluid. Spilling D.O.T. 4 brake fluid on molded-in-color surfaces will result in cosmetic damage. Spilling brake fluid on switches may render them inoperative.

2. Cover body surfaces, right handlebar switches and instrument panel to protect from spillage.

3. See Figure 1-8. Remove two fasteners from front master cylinder cover.

4. Add D.O.T. 4 BRAKE FLUID to master cylinder reservoir. Bring fluid level to within 1/8 in. (3.2 mm) of molded boss inside front master cylinder.

**NOTE**

Do not reuse brake fluid.

5. Slowly depress and release hand lever several times to build up hydraulic pressure, then hold brake hand lever in the depressed position.

6. While holding brake hand lever in the depressed position, open bleeder valve about 1/2-turn counterclockwise. Brake fluid will flow from bleeder valve and through tubing into clean container. When brake lever has moved 1/2 to 3/4 of its full range of travel, close bleeder valve (clockwise). Allow brake lever to return slowly to its released position.

7. Repeat steps 5-6 until all air bubbles are purged.

8. Tighten front caliper bleeder valve (metric) to 36-60 in-lbs (4-7 Nm).

9. Verify master cylinder fluid level as described in step 4.

10. Attach cover to front master cylinder reservoir and tighten fastener to 9-13 in-lbs (1.0-1.5 Nm).

11. Remove cover from molded-in-color surfaces, right handlebar switches and instrument panel.
Bleeding Rear Brake

NOTE
Hydraulic brake fluid bladder-type pressure equipment can be used to fill the brake master cylinder through the bleeder valve if master cylinder reservoir cover is removed to prevent pressurization.

1. See Figure 1-9. With motorcycle in upright position, install end of plastic tubing over rear caliper bleeder valve; place other end in a clean container.

CAUTION
Cover molded-in-color surfaces and use care when removing brake reservoir cover and adding D.O.T. 4 brake fluid. Spilling D.O.T. 4 brake fluid on molded-in-color surfaces will result in cosmetic damage.

2. See Figure 1-10. Remove cap and gasket from rear master cylinder reservoir.
3. Add D.O.T. 4 BRAKE FLUID to master cylinder reservoir with motorcycle upright (not on sidestand). Bring fluid level between upper and lower marks on reservoir.

NOTE
Do not reuse brake fluid.

4. Slowly depress and release brake pedal several times to build up hydraulic pressure, then hold brake pedal in the depressed position.
5. While holding brake pedal in the depressed position, open bleeder valve about 1/2-turn counterclockwise. Brake fluid will flow from bleeder valve and through tubing into clean container. When brake pedal has moved 1/2 to 3/4 of its full range of travel, close bleeder valve (clockwise). Allow brake pedal to return slowly to its released position.
6. Repeat steps 5-6 until all air bubbles are purged.
7. Tighten rear caliper bleeder valves (metric) to 36-60 in-lbs (4-7 Nm).
8. Verify master cylinder fluid level as described in step 4.
9. Install cover on master cylinder reservoir and tighten cap securely.
After completing repairs or bleeding the system, always test motorcycle brakes at low speed. If brakes are not operating properly or braking efficiency is poor, testing at high speeds could result in death or serious injury.

Check rear brake pedal operation:
- Before every ride.
- At the 1000 mile (1600 km) service interval.
- At every 5000 mile (8000 km) service interval thereafter.

**NOTE**
- See Figure 1-11. On the very end of the threaded brake rod, are two flat sides (2). To ensure proper thread engagement with the clevis (3), the flat sides must extend below the extruded nut (1) in the clevis by at least one full thread. This is the minimum rod engagement.
- Also, there should be a minimum of 0.030 in. (0.8 mm) between brake rod end and brake pedal.

**WARNING**
Threaded rod should not be adjusted to the point of contacting brake pedal. Improper adjustment could result in death or serious injury.

1. See Figure 1-12. Inspect for minimum and maximum brake rod engagement in brake clevis (4). Adjust as required.
2. Adjust brake pedal.
   a. See Figure 1-12. Loosen locknut (3) while holding rod adjuster (2). Move locknut away from top surface of clevis (4).
   b. Turn rod adjuster to set pedal height.
   c. Return locknut (3) to fit flush against top surface of clevis and tighten to 130-173.5 in-lbs (14.7-19.6 Nm).

**NOTE**
Brake pedal has no free play adjustment.
BRAKE PAD THICKNESS

**WARNING**

Always replace brake pads in complete sets for correct brake operation. Never replace just one brake pad. Failure to install brake pads as a set could result in death or serious injury.

Check brake pads for minimum thickness:
- At the 1000 mile (1600 km) service interval.
- At every 2500 miles (4000 km) service interval thereafter.
- At every scheduled service interval thereafter.

See Figure 1-13. Inspect brake pads for damage or excessive wear. Replace both pads as a set if friction material of either pad is worn to 0.040 in. (1.0 mm) or less. If this amount of wear occurs, wear grooves will disappear from friction material surface.

**BRAKE ROTOR THICKNESS**

**WARNING**

Do not allow brake fluid, bearing grease, lubricants, etc. to contact brake rotor when servicing motorcycle or reduced braking ability will occur, which could result in death or serious injury.

See Figure 1-14. Check brake rotors for minimum thickness:
- At the 1000 mile (1600 km) service interval.
- At every 2500 miles (4000 km) service interval thereafter.
- At every scheduled service interval thereafter.

1. Measure rotor thickness. Replace rotor if minimum thickness is less than 0.18 in. (4.5 mm). Replace drive bushings, fasteners, washers and springs whenever rotor is replaced.
2. Check rotor surface. Replace if warped or badly scored. See 2.5 FRONT WHEEL or 2.6 REAR WHEEL for procedure.
BRAKE PAD REPLACEMENT

Front Pad Removal
1. See Figure 1-15. Loosen pin hanger (2) but do not remove.
2. Rotate wheels so that caliper is centered between rotor mounting fasteners (1).
3. Remove lower caliper mounting fastener (4) that secures caliper to fork lower.
4. Loosen but do not remove upper caliper mounting fastener (3) that secures caliper to fork lower.
5. Remove pin hanger (2).
6. Rotate caliper counterclockwise to allow access to outer pad.
7. Remove outer pad from right side.
8. Remove inner pad from left side by pulling rearward, rotating pad 90 degrees and pulling through wheel opening.

Front Pad Installation
1. Push pistons in with suitable tool such as a clean paint scraper until fully seated in bores. Be careful not to damage rotor.
2. Install new inner pad from left side of motorcycle.
3. Install new outer pad from right side of motorcycle.
4. See Figure 1-15. Install pin (2) making sure it engages hole on both pads and spring clip.
5. Rotate caliper clockwise to align mounting fastener hole.
6. See Figure 1-15. Install lower caliper mounting fastener (4).
7. Tighten both caliper mounting fasteners (3 & 4) to 35-37 ft-lbs (48-50 Nm).
8. Tighten pin (2) to 11-15 ft-lbs (15-20 Nm).

NOTE
Avoid making hard stops for the first 100 miles (160 km) to allow new brake pads to “wear in” properly with the rotor.
**Rear Pad Removal**

1. See Figure 1-16. Remove rear caliper pin plug (3) and loosen pin (4).
2. Remove fastener securing p-clamp, wire form and brake line assembly to swingarm.
3. Remove two mounting fasteners (1) securing brake caliper and carrier assembly to swingarm.
4. Lift caliper and carrier assembly up and off of rotor.
5. Remove hanger pin (4).
6. Remove inner and outer pads, being careful not to dislodge pad spring.

**Rear Pad Installation**

1. See Figure 1-16. Check that retainer (2) is present.
2. See Figure 1-17. Check that pad spring is present. Should pad spring become dislodged, install with widest area of spring towards piston side of caliper.
3. Push piston in with suitable tool such as a clean paint scraper until fully seated in bore.
4. Install **new** inner and outer brake pads.
5. See Figure 1-16. Install hanger pin (4) making sure pin engages hole on both pads.
6. Install brake caliper and carrier assembly over rotor.
7. Install two mounting fasteners (1) through swingarm into carrier and tighten to 24-26 ft-lbs (33-35 Nm).
8. Tighten hanger pin to 11-15 ft-lbs (15-20 Nm).
9. Install pin plug (3). Tighten plug to 18-25 in-lbs (2-3 Nm).

**NOTE**

Avoid making hard stops for the first 100 miles (160 km) to allow **new** brake pads to “wear in” properly with the rotor.

---

**Figure 1-16. Rear Brake Caliper**

**Figure 1-17. Pad Spring, Rear Brake**
TIRE INFLATION

**WARNING**

Do not inflate any tire beyond its maximum inflation pressure as specified on tire sidewall. Overinflation may cause tire to suddenly deflate which could result in death or serious injury.

Check tire pressure and tread:

- Before every ride.
- At the 1000 mile (1600 km) service interval.
- At every scheduled service interval.

Check for proper front and rear tire pressures when tires are cold. Compare pressure against Table 1-6.

<table>
<thead>
<tr>
<th>TIRE</th>
<th>PRESSURE FOR SOLO RIDING</th>
<th>PRESSURE AT GVWR</th>
</tr>
</thead>
<tbody>
<tr>
<td>Front</td>
<td>36 PSI</td>
<td>248 kPa</td>
</tr>
<tr>
<td>Rear</td>
<td>38 PSI</td>
<td>262 kPa</td>
</tr>
</tbody>
</table>

TIRE REPLACEMENT

Treadwear indicator bars will appear on tire tread surfaces when 1/32 in. (0.794 mm) or less of tire tread remains. Arrows on tire sidewalls pinpoint location of wear bar indicators. Always remove tires from service before they reach the tread wear indicator bars (1/32 in. [0.794 mm] tread pattern depth remaining).

New tires are needed if any of the following conditions exist.

1. Tire wear indicator bars become visible on the tread surfaces.
2. Tire cords or fabric become visible through cracked sidewalls, snags or deep cuts.
3. A bump, bulge or split in the tire.
4. Puncture, cut or other damage to the tire that cannot be repaired.

WHEEL BEARINGS

**WARNING**

Never use compressed air to “spin-dry” bearings. Very high bearing speeds can damage unlubricated bearings. Spinning bearings with compressed air can also cause a bearing to fly apart, which could result in death or serious injury.

Check front and rear wheel bearings for wear:

- Every time a wheel is removed.
- When storing or removing the motorcycle for the season.

Check front wheel bearing:

- At every 5000 mile (8000 km) service interval.

Check rear wheel bearing:

- At every 10,000 mile (16,000 km) service interval.

Check wheel bearings for wear and corrosion. Excessive play or roughness indicates worn bearings. Replace bearings in sets only.
TRANSMISSION FLUID

Replace transmission fluid:
- At the 1000 mile (1600 km) service interval.
- At every 5000 mile (8000 km) service interval.

Transmission fluid capacity is approximately 1.0 quart (0.95 liter). For best results, drain fluid while hot.

1. On level surface, stand vehicle upright (not leaning on sidestand) to prevent chaincase lubricant from draining out of clutch cover opening when refilled.
2. See Figure 1-20. Position a suitable container under drain plug. Remove plug and drain fluid.
3. Wipe any foreign material from the magnetic drain plug. Reinstall plug and tighten to 14-30 ft-lbs (19-40.7 Nm).
4. Remove three fasteners and washers from clutch inspection cover. Remove clutch inspection cover with gasket from primary cover.

CAUTION

Do not overfill the transmission with fluid. Overfilling may cause rough clutch engagement and incomplete disengagement, clutch drag and/or difficulty finding neutral at engine idle.

5. See Figure 1-21. Add SPORT-TRANS FLUID (Part No. 98854-96 quart size; Part No. 98855-96 gallon size) as required until fluid level (3) is even with bottom of clutch diaphragm spring (2).
6. See Figure 1-19. Install clutch inspection cover tightening three fasteners and washers to 84-108 in-lbs (10-12 Nm).
7. Clean up any fluid that may have spilled on muffler.
ADJUSTMENT

Check clutch adjustment:

- At the 1000 mile (1600 km) service interval.
- At every 5000 mile (8000 km) service interval.

If clutch slips under load or drags when released, first check control cable adjustment. If cable adjustment is within specifications, adjust clutch mechanism as described below.

When necessary, lubricate cable with LUBIT-8 TUFOIL® CHAIN AND CABLE LUBE (Part No. HD-94968-85TV).

1. Raise rear wheel off floor using REAR WHEEL SUPPORT STAND (Part No. B-41174).
2. See Figure 1-22. Slide rubber boot (1) upward to expose adjuster mechanism. Loosen jam nut (3) from adjuster (4). Turn adjuster to shorten cable housing until there is a large amount of free play at clutch hand lever.
3. See Figure 1-19. Remove three fasteners and washers from clutch inspection cover. Remove clutch inspection cover and gasket from primary cover.
4. See Figure 1-23. Remove spring (1) and lockplate (2). Using a flat tip screwdriver, turn adjusting screw (3) counterclockwise until it lightly bottoms.
5. Turn adjusting screw clockwise 1/4 turn. Install lockplate and spring on adjusting screw flats. If hex on lockplate does not align with recess in outer ramp, rotate adjusting screw clockwise until it aligns.

NOTE
Spring installs on outboard side of hex lockplate.
6. Squeeze clutch hand lever to maximum limit three times. This sets the ball and ramp mechanism. Pull outer cable conduit and at the same time adjust cable adjuster to provide 1/16-1/8 in. (1.6-3.2 mm) free play at clutch hand lever. Adjust as follows:
   a. See Figure 1-24. Pull ferrule (end of cable housing) away from bracket. Gap between ferrule and bracket should be 1/16-1/8 in. (1.6-3.2 mm).
   b. See Figure 1-22. Set free play by turning adjuster (4).
   c. Tighten jam nut (3) against adjuster (4).
   d. Slide boot (1) over cable adjuster mechanism.

7. Change or add transmission fluid if necessary.

8. See Figure 1-19. Install clutch inspection cover and gasket using three fasteners and washers and tighten to 84-108 in-lbs (10-12 Nm).

9. Check clutch cable free play. See Step 6 above.
GENERAL

The drive belt tension on a new belt will be considerably tight and will loosen after approximately 1000 miles (1600 km). The drive belt tension is automatically maintained by the idler pulley. Axle alignment is not adjustable.

Check drive belt and idler pulley condition:
- At the 1000 mile (1600 km) service interval.
- At every 5000 mile (8000 km) service interval.

Replace drive belt and idler pulley assembly:
- At every 15,000 mile (24,000 km) service interval.

INSPECTION

Rear Sprocket

**NOTE**
If chrome chips or gouges to rear sprocket are large enough to be harmful, they will leave a pattern on the belt face.

1. Inspect each tooth of rear sprocket for:
   - Major tooth damage.
   - Large chrome chips with sharp edges.
   - Gouges caused by hard objects.
   - Excessive loss of chrome plating (see Step 2).

2. To check if chrome plating has worn off, drag a scribe or sharp knife point across the bottom of a groove (2) (between two teeth) with medium pressure.
   - If scribe or knife point slides across groove without digging in or leaving a visible mark, chrome plating is still good.
   - If scribe or knife point digs in and leaves a visible mark, it is cutting the bare aluminum. A knife point will not penetrate the chrome plating.

3. Replace rear sprocket if major tooth damage or loss of chrome exists.

Drive Belt

See Figure 1-25. Inspect drive belt for:
- Cuts or unusual wear patterns on both sides of belt.
- Outside edge bevelling (8). Some bevelling is common, but it indicates that sprockets are misaligned.
- Outside surface for signs of stone puncture (7). If cracks/damage exists near edge of belt, replace belt immediately. Damage to center of belt will require belt replacement eventually, but when cracks extend to edge of belt, belt failure is imminent.
- Inside (toothed portion) of belt for exposed tensile cords (normally covered by nylon layer and polyethylene layer). This condition will result in belt failure and indicates worn transmission sprocket teeth. Replace belt and transmission sprocket.
- Signs of puncture or cracking at the base of the belt teeth. Replace belt if either condition exists.

Idler Pulley

Inspect idler pulley for signs of uneven wear. Excessive play or roughness indicates worn bearings. Replace idler pulley as an assembly. See following section.

CLEANING

Keep dirt, grease, oil, and debris off the belt, idler pulley and sprockets. Clean the drive belt with a mild soap and water spray solution as required. Dry thoroughly. Do not immerse belt in solution.
Table 1-7. Drive Belt Wear Analysis in Figure 1-25.

INSPECTION

Check primary chain tension:

- At the 1000 mile (1600 km) service interval.
- At every 5000 mile (8000 km) service interval thereafter.

See Figure 1-26. Measure primary chain tension through the inspection cover opening. Adjust primary chains not meeting vertical free play specifications.

1. See Figure 1-26. Remove two fasteners with captive washers and primary chain inspection cover with gasket from primary cover.

2. See Figure 1-27. Check primary chain tension by measuring vertical free play.
   a. Measure vertical free play through chain inspection cover opening.
   b. Rotate engine to move primary chain to a different position on sprockets.
   c. Measure vertical free play several times, each time with primary chain moved so that the measurement is taken with sprockets rotated to the tightest chain position.

3. The tightest measurement taken in Step 2 must be within the specifications listed in Table 1-8. If necessary, adjust as described under 1.11 PRIMARY CHAIN in ADJUSTMENT.

   **NOTE**
   The initial primary chain vertical free play specification used at the assembly plant is 1/4-1/2 in. (6.4-12.7 mm) with a cold engine. The 1/4 in. (6.4 mm) minimum is only allowed at the absolute tightest point in the drive, as measured with specialized factory equipment. If a chain has less than 1/4 in. (6.4 mm) vertical free play (with a cold engine), adjust free play to the "field" specification of 3/8-1/2 in. (9.5-12.7 mm). The looser specification will avoid overtightening, which might otherwise occur during adjustment using "non-factory" equipment and methods.

4. See Figure 1-26. Install primary chain inspection cover and gasket to primary cover using two fasteners with captive washers. Tighten fasteners to 40-60 in-lbs (5-7 Nm).

Table 1-8. Primary Chain Tension

<table>
<thead>
<tr>
<th>ENGINE TEMPERATURE</th>

<tbody>
<tr>
<td>Cold</td>
<td>3/8-1/2 in.</td>
</tr>
<tr>
<td>Hot (normal running temperature)</td>
<td>1/4-3/8 in.</td>
</tr>
</tbody>
</table>
NOTE
If vertical free play cannot be set within the limits specified, then primary chain and/or chain adjuster are worn beyond adjustment limits. Replace parts as necessary. See 6.2 PRIMARY CHAIN.

1. See Figure 1-28. Loosen locknut (1).
2. Turn adjusting fastener (2):
   a. Clockwise (inward) to reduce free play.
   b. Counterclockwise (outward) to increase free play.
3. Tighten locknut (1) to 20-25 ft-lbs (27-34 Nm).

Figure 1-28. Chain Tension Adjusting Fastener
GENERAL

WARNING

Before evaluating and adjusting suspension settings, check the motorcycle’s tires. Tires must be in good condition and properly inflated. Failure to check the tires could result in death or serious injury.

Make all suspension adjustments in one or two click increments. Adjusting more than one or two clicks at a time may cause you to skip the best adjustment. Test ride after each adjustment. When an adjustment makes no difference, return to the previous adjustment and try a different approach.

NOTE

Evaluating and changing the rebound and compression damping is a very subjective process. Many variables affect motorcycle handling under different circumstances. Approach all changes carefully and consult Table 1-9.

<table>

</tbody>
</table>
Always adjust each fork leg to the same settings. Uneven adjustment between left and right forks may lead to a loss of control which could result in death or serious injury.

NOTE
All “turn settings” in Table 1-11 are “turns out from maximum”. That is, first gently turn adjustment screws fully clockwise (until they stop), then turn adjustment screws counterclockwise the amount specified in Table 1-9.

See Table 1-9. The recommended rebound and compression damping settings for various road and riding conditions are given in the table.

Setting Front Fork Preload
1. Check number of lines (3) to be showing for your load condition. Refer to Table 1-9.
2. See Figure 1-29. Adjust preload by turning the adjuster nut (2) with a wrench.

Setting Front Fork Rebound Damping
1. See Figure 1-29. Using a screwdriver, turn the slotted dial (1) clockwise until it stops. This is the maximum rebound damping setting.
2. Then turn the dial counterclockwise the recommended amount specified in Table 1-9.

Setting Front Fork Compression Damping
1. See Figure 1-30. Using a screwdriver, turn the slotted dial clockwise until it stops. This is the maximum compression damping setting.
2. Then turn the dial counterclockwise the recommended amount specified in Table 1-9.
Setting Rear Shock Preload

The factory setting is ramp number 2 position (ramp number 7 position being the tallest ramp and maximum preload). For recommended spring preload refer to Table 1-9.

1. Remove seat. See 2.41 SEAT.

2. See Figure 1-31. Change the spring preload by turning the preload adjuster at the upper part of the shock with the SHOCK SPANNER WRENCH (HD-94700-52C) or the wrench included in the tool kit.
   a. Turn adjuster to setting specified in Table 1-9. Rotate adjuster clockwise to increase preload.
   b. Rotate adjuster counterclockwise to decrease preload.

WARNING
After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

3. Install seat. See 2.41 SEAT.

Setting Rear Shock Rebound Damping

1. See Figure 1-32. Using a screwdriver, turn the slotted dial clockwise until it stops. This is the maximum rebound damping setting.

2. Then turn the dial counterclockwise the recommended amount specified in Table 1-9.
Setting Rear Shock Compression Damping

1. Remove seat. See 2.41 SEAT.

2. See Figure 1-33. Using a screwdriver, turn the slotted dial clockwise until it stops. This is the maximum compression damping setting.

3. Then turn the dial counterclockwise the recommended amount specified in Table 1-9.

**WARNING**

After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

4. Install seat. See 2.41 SEAT.

Figure 1-33. Rear Shock Compression Adjustment
GENERAL

The steering head bearings on the XB9S are sealed, angular contact bearings and do not require additional lubrication.

Check steering head bearing resistance:
- At every 5000 mile (8000 km) service interval.
- When storing or removing the motorcycle for the season.

INSPECTION

NOTES
- Check that throttle cables do not bind when measuring bearing resistance.
- Steering head bearings are sealed and do not require additional lubrication.
- Steering head bearing resistance is not adjustable. Replace bearings that do not meet resistance specifications.

1. Detach clutch cable at handlebar.
2. Place a scissor jack under jacking point and raise front wheel off ground. For location of jacking point see 2.29 EXHAUST SYSTEM.

WARNING

Steering must be smooth and free with no binding or interference. Anything interfering with steering system operation may cause loss of vehicle control, which could result in death or serious injury.

3. Check steering stem bearings for notches by turning front wheel full right and then left. Repeat if necessary.
4. Next place wheel facing straight ahead and grabbing both fork sides at the bottom move front-end forward and back to check for steering head play.
5. To inspect for correct steering head resistance turn front wheel all the way to the right.
6. See Figure 1-34. Hook a spring scale into the hole in the front axle. With scale 90 degrees from fork leg, pull front wheel to center position.
   a. The desired resistance is between 4.5-6.5 lbs (2.0-2.9 kg) with a maximum resistance of 7 lbs. (3.2 kg) to pull front wheel to center.
   b. If steering head resistance measurement is not within specification, see DETERMINING PROPER RESISTANCE.
7. When adjustment is complete, attach clutch cable and adjust. See 1.9 CLUTCH.

DETERMINING PROPER RESISTANCE

1. Detach clutch cable at handlebar and ensure that throttle cables do not bind before measuring steering head bearing resistance.
2. Remove steering stem pinch fastener at upper triple clamp.
3. Loosen steering stem capnut and back off several turns.
4. Remove lower triple clamp pinch fasteners, two per side.
5. Tighten steering stem capnut to 38-42 ft-lbs (52-57 Nm).
6. Turn front wheel all the way to the right.
7. See Figure 1-34. Hook a spring scale into the hole in the front axle. With scale 90 degrees from fork leg, pull front wheel to center position.
8. The desired resistance is between 4.5-6.5 lbs (2.0-2.9 kg) with a maximum resistance of 7 lbs. (3.2 kg).

NOTE

If the correct specification cannot be achieved, the steering head bearings must be replaced. See 2.18 STEERING HEAD BEARINGS.

9. Once correct steering head resistance has been verified, apply LOCTITE 272 to steering stem pinch bolt, install and tighten to 17-19 ft-lbs (23-26 Nm).
10. Apply LOCTITE 272 to lower triple clamp fasteners, install and tighten to 13-15 ft-lbs (18-20 Nm).
11. When adjustment is complete, attach clutch cable and adjust. See 1.9 CLUTCH.
12. Remove scissor jack.
INSPECTION

Check spark plugs:

- Inspect at every 5000 mile (8000 km) service interval.
- Replace every 10,000 mile (16,000 km) service interval.
- Use only Harley-Davidson 10R12A spark plugs (Part No. 27671-01K).

1. Remove left side air scoop to access front cylinder spark plug. See 2.36 AIR SCOOPS.
2. Disconnect spark plug wire from front spark plug.
3. Using a 5/8 in. box end wrench and 5/8 in. spark plug socket, remove front spark plug.
4. Remove seat. See 2.41 SEAT.
5. Remove airbox assembly. See 4.43 AIRBOX.
6. Disconnect spark plug wire from rear spark plug (use automotive spark plug boot remover/installer if required).
7. Using a 5/8 in. wobble socket and 12 in. extension, remove rear spark plug.
8. See Figure 1-35. Compare your observations of the plug deposits with the descriptions provided below.

   a. A wet, black and shiny deposit on plug base, electrodes and ceramic insulator tip indicates an oil fouled plug. The condition may be caused by one or more of the following: worn pistons, worn piston rings, worn valves, worn valve guides, worn valve seals, a weak battery or a faulty ignition system.

   b. A dry, fluffy or sooty black deposit indicates an air-fuel mixture that is too rich and/or engine idling for excessive periods.

   c. A light brown, glassy deposit indicates an overheated plug. This condition may be accompanied by cracks in the insulator or by erosion of the electrodes and is caused by an air-fuel mixture that is too lean, a hot-running engine, valves not seating or improper ignition timing. The glassy deposit on the spark plug is a conductor when hot and may cause high-speed misfiring. A plug with eroded electrodes, heavy deposits or a cracked insulator must be replaced.

   d. A plug with a white, yellow, tan or rusty brown powdery deposit indicates balanced combustion. Clean off spark plug deposits at regular intervals.

Figure 1-35. Typical Spark Plug Deposits
9. If the plugs require cleaning between tune-ups and replacement plugs are not available, proceed as follows:
   a. Degrease firing end of spark plug using ELECTRICAL CONTACT CLEANER. Dry plug with compressed air.
   b. Use a thin file to flatten spark plug electrodes. A spark plug with sharp edges on its electrodes requires 25-40% less firing voltage than one with rounded edges.

10. If the plugs cannot be cleaned, replace with 10R12A spark plugs (Part No. 27671-01K).

11. Check electrode gap with a wire-type feeler gauge. Gap should be 0.035 in. (0.9 mm).

12. Apply LOCTITE ANTI-SEIZE to threads of spark plugs. Install and tighten spark plugs to 11-18 ft-lbs (15-24 Nm).

   **NOTES**
   - Start threading rear spark plug with 3/8" fuel hose being careful not to cross thread spark plug.
   - Start front spark plug with fingers.
   - An extension may be needed to push on rear spark plug boot to ensure it is seated properly.

13. Connect spark plug wires. Verify that wires are securely connected to coil and spark plugs.

14. Install left side air scoop. See 2.36 AIR SCOOPS.

15. Install airbox assembly. See 4.43 AIRBOX.

   **WARNING**

   After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

16. Install seat. See 2.41 SEAT.
REMOVAL

CAUTION
Do not run engine without filter element in place. Debris could be drawn into the engine causing damage.

Check air cleaner filter element:

- Inspect at the 1000 mile (1600 km) service interval and at every 5000 mile (8000 km) service interval thereafter.
- Replace at every 20,000 mile (32,000 km) service interval.

NOTE
Inspect and replace air cleaner filter element more often if the motorcycle is run in a dusty environment.

1. Remove seat. See 2.41 SEAT.
2. Remove four fasteners, nylon washers and intake cover assembly. See 2.35 INTAKE COVER ASSEMBLY.
3. See Figure 1-37. Remove fuel vent tube (2) from vapor valve (3) and groove on top of airbox cover (1).
4. See Figure 1-37. Unlatch six latching tabs (4) and remove airbox cover from baseplate.
5. See Figure 1-38. Remove the filter element (1) from baseplate (2). Inspect and replace if necessary.

CAUTION
Cover the air horn so nothing can drop into the motor.

CLEANING AND INSPECTION

WARNING
Do not use gasoline or solvents to clean the filter element. Volatile/flammable cleaning agents may cause an intake system fire which could result in death or serious injury.

1. Check filter element. Hold filter element up to strong light source. The element can be considered sufficiently clean if light is uniformly visible through the element.
2. Thoroughly clean baseplate and inside of airbox.
3. See Figure 1-39. Make sure two crankcase breather hoses (1) and intake air sensor (2) are captured in baseplate behind velocity stack (3).
INSTALLATION

1. See Figure 1-38. Place filter element (1) on baseplate (2).

2. See Figure 1-37. Position airbox cover (1) over baseplate. Make sure air filter remains correctly positioned.

3. Install airbox cover by latching six latch tabs (4) to baseplate.

4. Position fuel vent tube (2) in groove on top of airbox and connect to fuel vent valve (3). Secure vent tube to vent valve with new cable strap.

5. Install intake cover assembly with four fasteners and nylon washers. Tighten fasteners to 12-36 in-lbs (1-4 Nm).

![Figure 1-39. Airbox Baseplate Assembly](image)

| 1. Breather hoses (2) |
| 2. Intake air sensor |
| 3. Velocity stack |

WARNING

After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

6. Install seat. See 2.41 SEAT.
THROTTLE CABLE

**WARNING**

Throttle cables must not pull tight when handlebars are turned fully to left or right fork stops. Be sure wires and throttle cables are clear of fork stops at steering head so they will not be pinched when fork is turned against stops. Steering must be smooth and free with no binding or interference. Anything interfering with steering system operation may cause loss of vehicle control, which could result in death or serious injury.

Check throttle cable adjustment:

- Before every ride.
- At every scheduled service interval.

With engine running, turn handlebars through full range of travel. If engine speed changes during this maneuver, turn engine OFF and adjust throttle cables as follows:

1. Remove airbox and baseplate. See 4.43 AIRBOX.
2. See Figure 1-40. Loosen cable adjuster lock (5) on each.
3. Turn adjusters (4) in direction which will shorten cable housings to minimum length.
4. Point front wheel straight ahead. Twist throttle control grip to fully open position; hold in position.
5. Turn adjuster on throttle control cable (2) until throttle cam stop touches stop plate. Tighten cable adjuster lock on throttle control cable adjuster; release throttle control grip.
6. Turn handlebars fully to right. Turn adjuster on idle control cable (3) until end of cable housing just touches the cable guide.
7. Twist and release throttle control grip a few times. Throttle plate must return to idle position each time throttle grip is released. If this is not the case, turn adjuster on idle control cable (shortening cable housing) until throttle control functions properly.
8. Tighten cable adjuster lock on idle control cable. Recheck operation of throttle control.
9. Recheck engine slow idle speed; adjust if required.
10. Install airbox, baseplate and intake cover assembly. See 4.43 AIRBOX.

**IDLE SPEED**

Check engine idle speed and adjust as required:

- At every 1000 mile (1600 km) service interval.
- At every 5000 miles (8000 km) service interval thereafter.

Regular idle speed is 1050-1100 RPM. Set idle speed using idle adjuster shown in Figure 1-41. Turn adjuster clockwise to increase idle speed or counterclockwise to decrease idle speed.
INSPECTION

Check ignition timing:
- At every 10000 mile (16000 km) service interval.
- After each removal of the cam position sensor.

CHECKING STATIC TIMING

CAUTION
Always wear proper eye protection when drilling. Flying debris may result in minor or moderate injury.

CAUTION
Carefully drill hole, applying minimum pressure, to just penetrate timer plate cover. Applying too much pressure will damage cam position sensor and/or timer plate.

NOTES
- It is not necessary to remove the spark plug to determine TDC compression stroke of the front cylinder in the following procedure.
- Do not remove the timing inspection cover to check the static timing. If timing must be corrected, the inspection plate will then be removed.

1. Raise rear wheel using a lift or jacking point. Tie down motorcycle for additional support.
2. Remove timing inspection plug.
3. Place transmission in 5th gear.
4. Raise sidestand.

NOTE
Sidestand must be raised to enable the starter interlock system.

5. Connect Digital Technician to data port on motorcycle.
7. Turn on ignition and move handlebar stop switch to the run position. Listen for fuel pump cycling to confirm ignition is active.
8. Turn or gently bump the flywheel in a forward direction using the rear wheel. Position the flywheel TDC mark at the very left edge of the inspection hole.
9. If the engine is coming up on the compression stroke for the FRONT (correct) cylinder, the screen will be displaying LOW - 0 volts with timing mark at left edge of window.
10. Gently bump flywheel forward in tiny increments.
11. See Figure 1-43. If the static timing is correct, the screen will switch to HIGH - 5 volts at the precise moment the timing mark exactly centers in the inspection window.
12. If engine is coming up on the compression stroke for the REAR (incorrect) cylinder, the screen will be displaying HIGH - 5 volts as timing mark is just coming into view at left edge of window and will switch to LOW - 0 volts at same point as the timing mark continues through the window. (If this is observed, turn flywheel forward one revolution to bring engine to compression stroke for front cylinder.)

NOTES
- If timing mark check point is overshot, bump flywheel backwards till TDC mark is at left edge of inspection window and repeat test bumping flywheel in forward (normal) direction.
- Never confirm timing while bumping flywheel backwards. This will give you an incorrect reading.

13. If timing is correct, install timing inspection plug and tighten to 120-180 in-lbs (14-20 Nm). If timing is not correct, see ADJUST TIMING in this section.

Figure 1-42. Timing Plug

Figure 1-43. Correct Timing
ADJUST TIMING

1. See Figure 1-44. Remove timing plate cover.
   a. Drill rivets holding the timing plate cover.
   b. Using a hook, remove timing plate cover.
2. See Figure 1-46. If timing is advanced (mark appears on left side of window) rotate timing plate counterclockwise.
3. Check timing. See CHECKING STATIC TIMING.
4. See Figure 1-47. If timing is retarded (mark appears on right side of window) rotate timing plate clockwise.
5. Recheck timing.

Figure 1-44. Timer Cover
Figure 1-45. Cam Position Sensor
Figure 1-46. Advanced Timing
Figure 1-47. Retard Timing
**HEADLIGHTS**

**INSPECTION**

**WARNING**

Do not modify ignition/light switch wiring to circumvent the automatic-on headlight feature. High visibility is an important consideration for motorcycle riders. Failure to have headlight on at all times could cause an accident, resulting in death or serious injury.

Check headlights for proper alignment:

- When the new owner takes delivery of the motorcycle.
- When there is a change in load (adding luggage, etc.).

1. In a location with low light, draw a horizontal line on a screen or wall that measures 29-31 in. (74-79 cm) above floor.

2. See Figure 1-48. Position motorcycle 25 ft (7.6 m) away from a screen or wall by measuring the distance from the front axle to the screen/wall.

3. Verify correct front and rear tire pressure. See 1.8 TIRES AND WHEELS.

4. Load vehicle with rider/passenger/cargo/accessories. Weight will compress vehicle suspension slightly.

5. Stand motorcycle upright with front fairing aimed straight forward.

6. Check LOW beam (right lens) for alignment.
   
   a. See Figure 1-49. Turn ignition switch to IGN. Set handlebar headlamp switch to LOW beam position.

   b. Check that the correct pattern of light is a double rectangular pattern and is aligned with the horizontal line as shown in Figure 1-48.

   c. Adjust headlight alignment. See ADJUSTMENT which follows.

7. Check HIGH beam (left) for alignment.

   a. See Figure 1-49. Set handlebar headlamp switch to HIGH beam position.

   **NOTE**

   Low beam lamp will not stay illuminated when high beam is activated.

   b. Check that the correct pattern of light is a circular pattern and is centered on the horizontal line as shown in Figure 1-48.

   c. Adjust headlamp alignment. See ADJUSTMENT section.

---

![Figure 1-48. Checking Headlight Alignment](image1)

![Figure 1-49. Headlamp Switch](image2)
Horizontal Alignment
See Figure 1-50. Loosen fasteners on right and left side of headlight housing to adjust the horizontal alignment.

Vertical Alignment
See Figure 1-51. Loosen fastener on the bottom of headlight housing to adjust the vertical alignment.

NOTE
Only loosen headlamp alignment fasteners enough to adjust headlamp. Once headlights are aligned, tighten fasteners to 48-72 in-lbs (5-8 Nm).
INSPECTION

1. Connect vehicle to Digital Technician.
2. Select data monitor screen.
3. Select TP degrees on screen.
4. Ignition and run switch should be in the on position with engine off and throttle in the closed position.
5. If closed throttle TP degree reading is not between 5.2° - 5.6°, TPS should be recalibrated. See ADJUSTMENT below.

ADJUSTMENT

1. Connect vehicle to Digital Technician.
2. Select data monitor screen.
3. Select TP degrees on screen.
4. See Figure 1-52. Back off idle adjustment until TPS is at 0° and then continue to back out one to two additional turns.
5. Open and **snap shut** throttle control grip 2-3 times.

**NOTE**

_This is to ensure that the throttle plate is completely closed before beginning recalibration._

7. Select the Buell calibrations tab.
8. Select Zero TPS function.

**NOTE**

_When calibration is complete, dialogue box will appear on Digital Tech screen with message display “Command Sent Successfully”._

9. Select OK to continue.
10. Select data monitor screen.
11. Select TP degrees on screen.
12. Turn idle speed screw in until the TPS degree reading is between 5.2° and 5.6°.
13. Select RPM/Speed and Temperature on screen and start vehicle.
14. Run vehicle until engine temperature is at 270 °F (132° C).
15. Set idle to 1050-1100 RPM.
16. Adjustment is complete.
GENERAL

WARNING

Gasoline is flammable. Do not store motorcycle having gasoline in tank within the home or garage where open flames, pilot lights, sparks or electric motors are present. Inadequate safety precautions may cause an accident which could result in death or serious injury.

If the motorcycle will not be operated for several months, such as during the winter season, there are several things which should be done to protect parts against corrosion, to preserve the battery and to prevent the buildup of gum and varnish in the fuel system.

1. Fill fuel tank and add a gasoline stabilizer. Use one of the commercially available gasoline stabilizers following the manufacturer’s instructions. Run engine until treated gasoline has had a chance to reach fuel injectors.

2. Remove battery and charge as needed to maintain the correct voltage. See 1.5 BATTERY MAINTENANCE.

3. Remove the spark plugs, inject a few squirts of engine oil into each cylinder and crank the engine 5-6 revolutions. Reinstall spark plugs. See 1.14 SPARK PLUGS.

4. Adjust primary chain. See 1.11 PRIMARY CHAIN.

5. Check tire inflation. See 1.8 TIRES AND WHEELS. If the motorcycle will be stored for an extended period of time, securely support the motorcycle so that all weight is off the tires.

WARNING

Do not apply any oil to brake rotors or brake pads. Oil on brake pads degrades braking efficiency and can result in an accident which could result in death or serious injury.

7. If motorcycle is to be covered, use a material that will breathe, such as light canvas. Plastic materials that do not breathe promote the formation of condensation.

REMOVAL FROM STORAGE

WARNING

After extended periods of storage and prior to starting vehicle, place transmission in gear, disengage clutch and push vehicle back and forth a few times to ensure proper clutch disengagement. Improper clutch disengagement could result in death or serious injury.

1. Charge and install battery. See 1.5 BATTERY MAINTENANCE.

2. Remove and inspect spark plugs. Replace if necessary. See 1.14 SPARK PLUGS.

3. Inspect air filter element. Replace if necessary. See 1.15 AIR CLEANER FILTER Element.

4. If fuel tank was drained, fill fuel tank with fresh gasoline.

5. Start the engine and run until it reaches normal operating temperature. Check fluids and refill to proper levels if required.
   a. Check engine oil level. See 1.6 ENGINE LUBRICATION SYSTEM.
   b. Check transmission fluid level. See 1.9 CLUTCH.

GENERAL

The following check list can be helpful in locating most operating troubles. Refer to the appropriate sections in this Service Manual for detailed procedures.

ENGINE

Starter Motor Does Not Operate or Does Not Turn Engine Over

1. Engine stop switch in OFF position.
2. Ignition key switch not ON.
3. Discharged battery or loose or corroded connections. (Solenoid chatters.)
4. Starter control relay or solenoid not functioning.
5. Electric starter shaft pinion gear not engaging or overrunning clutch slipping.
7. Starter interlock circuit malfunction.

Engine Turns Over But Does Not Start

NOTE
See 4.11 ENGINE CRANKS BUT WILL NOT START for specific tests.

1. Fuel tank empty.
2. Discharged battery, loose or broken battery terminal connections.
3. Fouled spark plugs.
4. Loose or shorting spark plug cables or connections.
5. Ignition timing badly out of adjustment.
6. Loose wire connection at coil or battery connection or plug between ignition sensor and module. See Section 4.
7. Ignition coil not functioning.
8. Ignition module not functioning.
9. Ignition sensor not functioning.
11. Damaged wire or loose connection at battery terminals or coil.
12. Intermittent short circuit due to damaged wire insulation.
13. Water or dirt in fuel system and throttle body or filter.
15. Intake manifold is closed off restricting fuel flow.
16. Incorrect valve timing.
17. O2, IAT or ET sensors damaged or malfunctioning. See dealer.
18. TP Sensor not set properly. See dealer.
20. Inoperative fuel pump. See dealer.

Starts Hard

1. Spark plugs in bad condition, have improper gap or are partially fouled.
2. Spark plug cables in bad condition and shorting.
3. Battery nearly discharged.
4. Loose wire connection at one of the battery terminals, at coil or at plug between ignition sensor and module.
5. Throttle controls not adjusted correctly.
6. Ignition coil not functioning.
7. Engine oil too heavy (winter operation).
8. Ignition not timed properly. See dealer.
9. Vapor vent valve plugged or fuel line closed off restricting fuel flow.
10. Water or dirt in fuel system.
11. Air leak at intake manifold.
12. Valves sticking.
13. TP Sensor and/or fast idle screw not set properly. See dealer.
14. O2, IAT or ET sensors damaged or malfunctioning. See dealer.

Starts But Runs Irregularly or Misses

NOTE
See 4.15 MISFIRE for specific tests.

1. Spark plugs in bad condition or partially fouled.
2. Spark plug cables in bad condition and shorting.
3. Spark plug gap too close or too wide.
4. Ignition coil not functioning.
5. Ignition module not functioning.
6. Ignition sensor not functioning.
7. Battery nearly discharged.
8. Damaged wire or loose connection at battery terminals or coil.
9. Intermittent short circuit due to damaged wire insulation.
10. Water or dirt in fuel system and throttle body or filter.
11. Vapor vent valve plugged.
12. Throttle controls improperly adjusted.
13. Air leak at intake manifold or air filter.
14. Damaged intake or exhaust valve.
15. Weak or broken valve springs.
16. Incorrect valve timing.
17. O2, IAT or ET sensors damaged or malfunctioning. See dealer.
18. TP Sensor not set properly. See dealer.
20. Inoperative fuel injector. See dealer.
21. Obstructed fuel tank vent valve or pinched vent tube. See dealer.
Spark Plug Fouls Repeatedly
1. Incorrect spark plug.
2. Piston rings badly worn or broken.
3. Valve stem seals worn or damaged.
4. Valve guides badly worn.
5. Sensors damaged.

Pre-Ignition or Detonation (Knocks or Pings)
1. Excessive carbon deposit on piston head or combustion chamber.
2. Incorrect heat range spark plug.
4. Ignition timing advanced.
5. Fuel octane rating too low.
6. Intake manifold vacuum leak.

Overheating
1. Insufficient oil supply or oil not circulating.
2. Clogged or damaged fins on oil cooler.
3. Cooling fan not operating properly.
4. Leaking valves.
5. Heavy carbon deposit.
6. Ignition timing retarded.

Valve Train Noise
1. Hydraulic lifter not functioning properly.
2. Bent push rod.
3. Cam, cam gears or cam bushings worn.
4. Rocker arm binding on shaft.
5. Valve sticking in guide.

Excessive Vibration
1. Engine tie-bars loose, broken or improperly spaced.
2. Isolator mounting fasteners loose.
4. Primary chain badly worn or links tight as a result of insufficient lubrication.
5. Wheels not aligned and/or tires worn.
7. Wheels not balanced correctly.

Oil Does Not Return To Oil Tank
1. Oil tank empty.
2. Return pump gears damaged.
3. Oil feed pump not functioning.
4. Restricted oil lines or fittings.

Engine Uses Too Much Oil or Smokes Excessively
1. Piston rings badly worn or broken.
2. Valve stem seals worn or damaged.
3. Valve guides worn.

Engine Leaks Oil From Cases, Push Rods, Hoses
1. Loose parts.
2. Imperfect seal at gaskets, push rod cover, washers, etc.
3. Restricted oil return line to tank.
4. Restricted breather passage(s) to air cleaner.

Alternator Does Not Charge
1. Regulator-rectifier module not functioning.
2. Rectifier not grounded.
3. Engine ground wire loose or broken.
4. Loose or broken wires in charging circuit.
5. Stator not functioning.
6. Rotor not functioning.

Alternator Charge Rate Is Below Normal
1. Regulator-rectifier module not functioning.
2. Stator not functioning.
3. Rotor not functioning.
4. Weak battery.
5. Loose connections.

Fuel System Floods
1. Inlet valve sticking.
2. Inlet valve and/or valve seat worn or damaged.
3. Dirt or other foreign matter between valve and its seat.

Poor Fuel Economy
1. O2 sensor damaged or malfunctioning (bike running rich). See dealer.
HOME

TRANSMISSION

Shifts Hard
1. Clutch dragging slightly.
2. Shifter forks (inside transmission) damaged.
3. Corners worn off shifter clutch dogs (inside transmission).

Jumps Out of Gear
1. Shifter engaging parts (inside transmission) badly worn and rounded.
2. Shifter forks bent.
3. Damaged gears.

CLUTCH

Slips
1. Clutch controls improperly adjusted.
2. Worn friction plates.

Drags or Does Not Release
1. Clutch controls improperly adjusted.
2. Clutch plates excessively warped.

Chatters
1. Friction or steel plates worn, warped or dragging.

CHASSIS

Irregular/Inadequate Brake Action
1. Master cylinder low on fluid.
2. Brake line contains air bubbles or moisture.
3. Master or wheel cylinder piston worn.
4. Brake pads covered with grease or oil.
5. Brake pads badly worn to minimum lining thickness.
6. Brake rotor badly worn or warped.
7. Brake pads dragging or excessive braking (brake fades due to heat buildup).
8. Insufficient brake pedal or hand lever free play (brake drags).

Handling Irregularities
1. Tires improperly inflated. See 1.8 TIRES AND WHEELS. Do not overinflate.
2. Loose wheel axle. Tighten front axle to 39-41 ft-lbs (53-56 Nm). Tighten rear axle to 48-52 ft-lbs (65-70 Nm).
3. Excessive wheel hub bearing play.
4. Rims and tires out-of-true sideways (tire runout should not be more than 0.080 in. (2.03 mm)).
5. Rims and tires out-of-round or eccentric with hub (tire runout should not be more than 0.060 in. (1.5 mm)).
6. Irregular or peaked front tire tread wear.
7. Tire and wheel unbalanced or weights on wrong side of wheel.
8. Steering head bearings improperly tightened or worn. See 1.13 STEERING HEAD BEARINGS. Check for proper torque and replace worn bearings. See 2.17 FORK CLAMPS, UPPER AND LOWER.
9. Shock absorber or front forks not functioning normally due to incorrect adjustment. See 1.12 SUSPENSION DAMPING ADJUSTMENTS.
10. Heavy front end loading. Non-standard equipment on the front end (such as heavy radio receivers, extra lighting equipment or luggage) tends to cause unstable handling.
When making adjustments, remember there are two mediums in setting up a bike, geometry and suspension. Both components work together because suspension is a part of geometry. In order to solve handling problems, it is important to diagnose the problem’s true nature.

Chattering, sliding or an uncomfortable feeling are suspension-related. Handling and a swinging fork are geometry-related, but often these unwanted characteristics can be solved by suspension adjustments.

The following tables list possible suspension and operating troubles and their probable causes.

### Table 1-10. General Suspension Problems

<table>
<thead>
<tr>
<th>TROUBLESHOOTING CONDITION</th>
<th>ADJUSTMENT SOLUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bike wallows through turns. Feels loose or vague after bumps. Wheel tends to “pogo” after passing over a bump. This is noticeable by watching the bike continue to bounce as it travels over multiple bumps.</td>
<td>Increase rebound damping.</td>
</tr>
<tr>
<td>Wheel responds to bump, but doesn’t return to ground quickly after bumps. This is more pronounced over a series of bumps and is often referred to as “packing down.”</td>
<td>Reduce rebound damping.</td>
</tr>
<tr>
<td>The bike bottoms out or dips while cornering. Bike has excessive brake dive. Harsh ride particularly over washboard surfaces. Bumps kick through handlebars or seat. Suspension seems not to respond to bumps. This is evidenced by tire chattering (a movement with short stroke and high frequency) through corners or by jolting the rider over rough roads.</td>
<td>Increase compression damping. Reduce compression damping.</td>
</tr>
</tbody>
</table>

### Table 1-11. Rear Suspension Problems

<table>
<thead>
<tr>
<th>TROUBLESHOOTING CONDITION</th>
<th>ADJUSTMENT SOLUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Pumping on the Rear” occurs when you are accelerating out of a corner. This problems occurs in two varieties. 1. The first type has a movement with a long stroke and a high frequency. 2. The second version has a movement with a short stroke and high frequency.</td>
<td>1. The shock is too soft. Increase compression damping. If the adjuster is already set to the maximum, add more preload to the spring (one turn maximum). 2. In this case the shock is too hard. Decrease compression damping.</td>
</tr>
<tr>
<td>Chattering during braking.</td>
<td>Decrease the compression damping. If the problem persists, decrease rebound damping for a faster rebound rate. Less spring preload may also help.</td>
</tr>
<tr>
<td>Lack of tire feedback.</td>
<td>The suspension is too soft. Increase compression damping.</td>
</tr>
<tr>
<td>Sliding during cornering. Sliding may occur going into the corner or accelerating out of the corner.</td>
<td>The suspension is too hard. Decrease compression damping.</td>
</tr>
</tbody>
</table>

### Table 1-12. Front Suspension Problems

<table>
<thead>
<tr>
<th>TROUBLESHOOTING CONDITION</th>
<th>ADJUSTMENT SOLUTION</th>
</tr>
</thead>
<tbody>
<tr>

GENERAL

⚠️ WARNING
This motorcycle does NOT have a locking sidestand. Always park the motorcycle on a level, firm surface. An unbalanced motorcycle could fall over resulting in death or serious injury.

⚠️ WARNING
If the sidestand is not in the full forward position when vehicle weight is rested on it, the vehicle could fall over, which could result in death or serious injury.

The sidestand is on the left side and swings downward to support the motorcycle for parking.

The sidestand also plays a role in operation of the starter interlock system which shuts OFF the ignition if an attempt is made to put the vehicle in motion with the sidestand down.

The starter interlock will shut the ignition OFF if the motorcycle is in gear, the sidestand is left down and the clutch is engaged (clutch lever is released).

The sidestand activates the integral sidestand switch which is part of the starter interlock system. See 7.5 STARTER INTERLOCK for more information.

INSPECTION

1. Test the sidestand in the following manner. Without motorcycle weight resting on it, side stand should move freely into extended (down) and retracted (up) positions.

2. Check sidestand switch (starter interlock) for proper operation after the first 1500 miles (2400 km) and every 2500 miles (4000 km) thereafter. See 7.5 STARTER INTERLOCK.

**NOTE**

Gross Vehicle Weight Rating (GVWR) (maximum allowable loaded vehicle weight) and corresponding Gross Axle Weight Ratings (GAWR) are given on an information decal located on the steering head.

**WARNING**

Do not inflate any tire beyond its maximum inflation pressure as specified on tire sidewall. Overinflation may cause tire to suddenly deflate which could result in death or serious injury.

GENERAL

WARNING

Tires must be correctly matched to wheel rims. Only the tires listed in the fitment tables below can be used for replacement. Mismatching tires and rims can cause damage to the tire bead during mounting. Using tires other than those specified can adversely affect motorcycle handling and could result in death or serious injury.

See Figure 2-1. Tire sizes are molded on the sidewall. Rim size and contour are marked on the rim’s exterior surface.

Example: **MT 3.5 x 17.0 DOT**

- **MT** designates the rim contour.
- **3.5** is the width of the bead seat measured in inches.
- **17.0** is the normal diameter of the rim in inches, measured at the bead seat diameter.

Table 2-6. Tire Fitment-Tubeless Cast Wheels

<td>MT 5.5 x 17.0 DOT</td>
<td>0.33 in.</td>
<td>180/55 ZR17 D207U</td>
</tr>
</tbody>
</table>

**DOT** means that the rim meets Department of Transportation Federal Motor Vehicle Safety Standards. See Table 2-6.
GENERAL

The full 17 digit serial or Vehicle Identification Number (V.I.N.) is stamped on the steering head and on an information decal at the same location.

See Figure 2-2. An abbreviated V.I.N. is stamped on the front left side of the crankcase.

NOTE

See Figure 2-3. Always give the V.I.N. or abbreviated V.I.N. when ordering parts or making inquiries about your Buell motorcycle.

Sample V.I.N. as it appears on the steering head - 4MZSX12J133450001
Sample abbreviated V.I.N. as it appears on the left side crankcase - SX123450001
GENERAL

Good handling and maximum tire mileage are directly related to the care of wheels and tires. Regularly inspect wheels and tires for damage and wear. If handling problems occur, see 1.21 TROUBLESHOOTING or Table 2-7.

See 1.8 TIRES AND WHEELS for tire pressures. Keep tires inflated to the recommended air pressure. Always balance the wheel after replacing a tire.

WARNING

Do not inflate any tire beyond its maximum inflation pressure as specified on tire sidewall. Overinflation may cause tire to suddenly deflate which could result in death or serious injury.

TROUBLESHOOTING

See Figure 2-4. Check tire inflation pressure at least once each week. At the same time, inspect tire tread for punctures, cuts, breaks and other damage. Repeat the inspection before long trips.
To prevent death or serious injury, use the following guidelines when installing a new tire or repairing a flat:

1. Always locate and eliminate the cause of the original tire failure.
2. Do not patch or vulcanize a tire casing. These procedures weaken the casing and increase the risk of a blowout.
3. The use of tires other than those specified can adversely affect handling which could result in death or serious injury.
4. Tires and wheels are critical items. Since the servicing of these components requires special tools and skills, Buell recommends that you see your dealer for these services.

**WARNING**

Buell recommends replacement of any tire punctured or damaged. In some cases small punctures in the tread area may be repaired from within the demounted tire by your Buell dealer. Speed should not exceed 50 mph (80 km/h) for the first 24 hours after repair and the repaired tire should NEVER be used over 80 mph (129 km/h). In emergency situations, if a temporary repair is made, ride slowly with as light of a load as possible until the tire is permanently repaired or replaced. Failure to follow this warning could result in death or serious injury.

**WARNING**

Replace excessively worn tires. Excessively worn tires adversely affect motorcycle traction, steering and handling and could result in death or serious injury.

At regular intervals of 2500 miles (4000 km) or whenever handling irregularities are noted, perform the recommended service checks. Refer to Table 2-7.

If tires must be replaced, same as original equipment tires must be used. Other tires may not fit correctly and may be hazardous to use.
REMOVAL

1. Place a scissor jack under jacking point and raise front wheel off ground. For location of jacking point see Figure 2-99.

   **NOTE**
   Do not operate front brake lever with front wheel removed or caliper pistons may be forced out. Reseating pistons requires caliper disassembly.

2. Remove the right side fender fasteners. See 2.32 FENDERS.

3. See Figure 2-5. Loosen front axle pinch fasteners (2) (metric) on front fork.

4. Remove axle (1).

   **NOTE**
   The front axle is left handed thread.

5. See Figure 2-6. Raise the wheel up until the rotor clears the caliper and rotate the fork leg counterclockwise allowing wheel clearance for removal.

6. Remove wheel.
Bearing Removal

**NOTE**
On single disc wheels, always remove the brake disc side first. If the wheel has two brake discs, remove the left bearing first.

1. See Figure 2-7. Remove wheel bearings using WHEEL BEARING REMOVER/INSTALLER KIT (Part No. B-43993-50) and WHEEL BEARING REMOVER AND INSTALLER (Part No. HD-44060).

2. Sparingly apply EXTREME PRESSURE LUBRICANT (Part No. J-23444-A) to the threads of the short forcing screw (1) to prolong service life and ensure smooth operation.

3. Assemble the short forcing screw (1), nut (2), Nice bearing (3), washer (4) and bridge (5) from the WHEEL BEARING INSTALLER/REMOVER (Part No.HD-44060).

4. See Figure 2-8. Insert the FRONT WHEEL BEARING REMOVER COLLET (Part No. B-43993-7, from kit Part No. B-43993-50) into the wheel bearing until it fully seats against the bearing.

5. Insert the ball bearing into the collet.

6. See Figure 2-9. Thread the puller assembly (1) into the collet (2).

7. Hold the collet (2), and turn the forcing screw (3) to expand the collet.

8. See Figure 2-10. Place the bridge (1) against the wheel hub.

9. Hold the forcing screw (2), and turn the nut (3) clockwise until the bearing is free of the hub.
10. See Figure 2-10. Loosen the nut (1), and back off the bridge (2). Hold the forcing screw (3) while holding the collet (4) to remove the forcing screw from the collet.

11. See Figure 2-11. Remove the ball bearing (5) and wheel bearing (6) from the collet (4).

12. See Figure 2-12. Remove the spacer.

13. Repeat Steps 4-12 for the bearing on the other side of the wheel.

Front Rotor Removal

1. See Figure 2-18. Remove and discard rotor mounting fasteners (7).

2. Remove and inspect brake rotor (6) for wear and warping. See 1.8 TIRES AND WHEELS.

3. Remove drive bushings (8) and discard.

4. Remove washers (9) and discard.

5. Remove front brake springs (4) and discard.

CLEANING AND INSPECTION

WARNING

Never use compressed air to “spin-dry” bearings. Very high bearing speeds can damage unlubricated bearings. Spinning bearings with compressed air can also cause a bearing to fly apart, which could result in death or serious injury.

1. Inspect all parts for damage or excessive wear.

NOTE

XB wheel bearings are designed as sealed bearings which are not intended to be disassembled, serviced or cleaned with solvents.

WARNING

Always replace brake pads in complete sets for correct brake operation. Never replace just one brake pad. Failure to install brake pads as a set could result in death or serious injury.

2. Inspect brake rotor and pads. See 1.7 BRAKE SYSTEM MAINTENANCE.
ASSEMBLY

1. See Figure 2-18. Install spacer (5).

2. Install new wheel bearings (2) into hub using suitable driver. Press on outer race only.

NOTE
Press the rotor side bearings in first ensuring it is seated on the shoulder of the wheel. Followed by pressing the alternate side until it contacts the spacer.

WARNING
Do not allow brake fluid, bearing grease, lubricants, etc. to contact brake rotor or reduced braking ability will occur, which could result in death or serious injury.

Bearing Installation

NOTE
On single disc wheels, always install the brake disc side first. If the wheel has two brake discs, install the left bearing first.

The following procedure describes the bearing installation for the front wheel; the procedure for the rear wheel is the same.

1. See Figure 2-13. Install the Backing Plate (Part No. B-43993-11) onto the long forcing screw from the Wheel Bearing Installer/Remover (Part No. HD-44060), with the smaller diameter toward the wheel hub. Insert the forcing screw and backing plate into the wheel hub.

2. See Figure 2-14. Sparingly apply EXTREME PRESSURE LUBRICANT (Part No. J-23444-A) to the threads of the long forcing screw (1) to prolong service life and ensure smooth operation.

3. Insert a new wheel bearing (2) squarely into the hub, with the lettered side pointing out (away from the wheel).

4. Slide the FRONT BEARING INSTALLER (Part No. B-43993-9, from kit Part No. B-43993-50) (3) onto the forcing screw (1), with the smaller diameter toward the bearing bore.

5. Install a washer (4), Nice bearing (5) and nut (6) onto the forcing screw (1).

6. While holding the forcing screw (1), tighten the nut (6) until the bearing is flush with the hub.

7. Remove the nut, bearing, washer, FRONT BEARING INSTALLER (Part No. B-43993-9) and forcing screw.
8. See Figure 2-15. Remove the BACKING PLATE (Part No. B-43993-11) from the long forcing screw. Reinstall the Backing Plate onto the forcing screw, with the smaller diameter toward the hex-head.

9. Insert the forcing screw through the wheel hub on the opposite side of the wheel.

10. See Figure 2-16. Install the spacer.

11. See Figure 2-17. Insert a new wheel bearing (1) squarely into the hub, with the lettered side pointing out (away from the wheel).

12. Slide the FRONT BEARING INSTALLER (Part No. B-43993-9) (2) onto the forcing screw (3), with the smaller diameter toward the bearing bore.

13. Install a washer (4), Nice bearing (5) and nut (6) onto the forcing screw (3).

**NOTE**
See Figure 2-16. Center the spacer while installing the wheel bearing. Failure to center the spacer could cause the bearing not to pull in straight.

14. While holding the forcing screw (3), tighten the nut (6) until the bearing is flush with the hub.

15. Remove the nut, bearing, washer, FRONT BEARING INSTALLER (Part No. B-43993-10) and forcing screw.

16. Install the wheel. See INSTALLATION/2.5 FRONT WHEEL.
Front Rotor Installation

1. See Figure 2-18. Install new spring (4).
2. Install new washers (9).
3. Install drive bushings (8) into rotor.

**NOTE**
Note the identifying mark of rotor is up and radius end of drive bushing (8) toward center of wheel.

4. Align reference dot on front rotor with the valve stem.
5. Install new rotor mounting fasteners in a criss-cross pattern around the wheel to insure proper fitting between rotor, fastener and bushing. Tighten to 25-27 ft-lbs (34-37 Nm).

**CAUTION**
Rotor mounting fasteners must be seated into drive bushings and drive bushings must be fitted into rotor properly. Failure to comply may affect braking ability and lead to brake failure which could result in death or serious injury.
1. Raise front wheel to allow clearance for the caliper to swing under and inside the front rotor.

2. See Figure 2-19. Install caliper.
   a. Align wheel so that rotor mounting fasteners straddle caliper.
   b. Rotate right front fork counterclockwise to align caliper with rotor.
   c. Lower front wheel into caliper assembly.

3. Install front axle.
   a. Apply LOCTITE ANTI-SEIZE LUBRICANT to axle.
   b. See Figure 2-20. With pinch fasteners (metric) loose, insert threaded end of axle (1) through left side fork, wheel hub and thread into right fork.
   c. Compress the front suspension to make sure it is free and not binding.
   d. Tighten axle (1) (metric) to 39-41 ft-lbs (53-56 Nm).

   **NOTE**
   The front axle is left handed thread.

4. See Figure 2-20. Tighten the front axle pinch fasteners (2) to 20-22 ft-lbs (27-30 Nm).

5. Install right side fender fasteners. See 2.32 FENDERS.
REAR WHEEL

REMOVAL

1. See Figure 2-21. Remove caliper carrier from swingarm by removing caliper carrier fasteners. See 2.15 REAR BRAKE CALIPER.

   NOTE
   Do not operate rear brake pedal with rear wheel removed or caliper piston may be forced out. Reseating piston requires caliper disassembly.

   Figure 2-21. Rear Brake Caliper Carrier Fasteners

2. Remove drive belt. See 1.10 DRIVE BELT.

   Figure 2-22. Rear Wheel Mounting, Right Side

   1. Axle
   2. Pinch bolt fastener

   Figure 2-22. Rear Wheel Mounting, Right Side

3. See Figure 2-22. Remove rear axle (1).

4. Remove rear wheel.

CLEANING AND INSPECTION

   WARNING
   Never use compressed air to “spin-dry” bearings. Very high bearing speeds can damage unlubricated bearings. Spinning bearings with compressed air can also cause a bearing to fly apart, which could result in death or serious injury.

1. Inspect all parts for damage or excessive wear.
2. Inspect brake rotor. See 1.7 BRAKE SYSTEM MAINTENANCE.

DISASSEMBLY

1. Remove sprocket.
   a. Remove sprocket fasteners and washers. Discard fasteners.
   b. Remove sprocket from wheel.

2. Remove rear rotor.
   a. See Figure 2-24. Remove and discard rotor mounting fasteners (1).
   b. Remove and inspect brake rotor for wear and warping. See BRAKE ROTOR THICKNESS in 1.7 BRAKE SYSTEM MAINTENANCE.

3. Remove rear wheel bearings using BUSHING AND BEARING PULLER (Part No. B43993-8) and WHEEL BEARING REMOVER AND INSTALLER (Part No. HD-44060).

   NOTE
   The procedure for the rear wheel bearing removal is the same as front wheel bearing removal. See Bearing Removal in 2.5 FRONT WHEEL.

4. Remove rear wheel spacer (4).

   NOTE
   For wheel bearing removal follow identical procedure as used for front wheel.
WARNING
Do not allow brake fluid, bearing grease, lubricants, etc. to contact brake rotor or reduced braking ability will occur, which could result in death or serious injury.

NOTES
- The procedure for the rear wheel bearing installation is the same as front wheel bearing installation. See Bearing Installation in 2.5 FRONT WHEEL.
- Install rear wheel bearings using REAR BEARING INSTALLER (Part No. B-43993-10) and WHEEL BEARING REMOVER AND INSTALLER (Part No. HD-44060).

1. See Figure 2-24. Install wheel bearing (3) on rotor side of motorcycle.
2. Install rear wheel spacer (4).
3. Install wheel bearing (3) on sprocket side of motorcycle.
4. Install sprocket.
   a. Position sprocket (6) on wheel (5) keeping lip of sprocket facing the inside.
   b. Install new sprocket fasteners (7) and washers tightening to 35-37 ft-lbs (48-50 Nm).
5. See Figure 2-24. Install rear rotor (2).
   a. Position rear brake rotor (2) on wheel (5).
   b. Install brake rotor (2) with new rotor mounting fasteners (1) and tighten to 25-27 ft-lbs (34-37 Nm).

INSTALLATION

CAUTION
Never tighten rear axle with swingarm brace removed.

1. See Figure 2-24. Install the rear axle by threading partially into swingarm.
   a. Center wheel in swingarm and lower bike to align swingarm and hub.
   b. See Figure 2-23. Coat the axle with ANTI-SEIZE LUBRICANT.
   c. Slide axle through right side of swing arm and wheel hub.
2. Install drive belt. See DRIVE BELT INSTALLATION in 1.10 DRIVE BELT.
3. Install idler pulley. See IDLER PULLEY INSTALLATION in 1.10 DRIVE BELT.
4. Install sprocket cover. See 2.31 SPROCKET COVER.

GENERAL

Check wheels for lateral and radial runout before installing a new tire.

Rim Lateral Runout

1. See Figure 2-25. Install truing arbor in wheel hub and place wheel in WHEEL TRUING AND BALANCING STAND (Part No. HD-99500-80).
2. Tighten arbor nuts so hub will turn on its bearings.
3. Check rim lateral runout by placing a gauge rod or dial indicator near the rim bead. Replace wheel if lateral runout exceeds specification shown in Table 2-8.

Rim Radial Runout

1. See Figure 2-26. Install truing arbor in wheel hub and place wheel in WHEEL TRUING AND BALANCING STAND (Part No. HD-99500-80).
2. Tighten arbor nuts so hub will turn on its bearings.
3. Check radial runout as shown. Replace wheel if runout exceeds specification shown in Table 2-8.

</tr>
</tbody>
</table>
GENERAL

Inspect tires for punctures, cuts, breaks and wear at least weekly.

WARNING

- Always check both tire sidewalls for arrows indicating forward rotation. Some tires require different tire rotation depending on whether tire is used on front or rear wheel. Installing a tire with the wrong rotation could result in death or serious injury.

- Dunlop front and rear tires for Buell motorcycles are not the same. They are not interchangeable. Use front tire ONLY for a front tire. DO NOT put a rear tire on the front of a vehicle. Failure to follow this warning could result in death or serious injury.

CAUTION

Some tires have arrows molded into the tire sidewall. These tires should be mounted on the rim with the arrow pointing in the direction of forward rotation. The yellow circle on the sidewall is a balance mark and should be aligned 180 degrees from the balance mark (blue dot) on inside of rim.

REMOVAL

1. Remove wheel from motorcycle. See 2.5 FRONT WHEEL or 2.6 REAR WHEEL.

2. Deflate tire.

3. See Figure 2-27. Loosen both tire beads from rim flange.

WARNING

Do not use excessive force when starting bead over rim. Excessive force may damage tire or rim and adversely affect handling which could result in death or serious injury.

4. If a bead breaker machine is not available, attach RIM PROTECTORS (Part No. HD-01289) to the rim. Using tire tools (not sharp instruments), start upper bead over edge of rim at valve. Repeat all around rim until first bead is over rim.

5. See Figure 2-28. Push lower bead into rim well on one side and insert tire tool underneath bead from opposite side. Pry bead over rim edge. Remove tire from rim.

6. Remove valve stem if it is damaged or leaks.

7. Mount tire on TIRE SPREADER (Part No. HD-21000) for inspection and repair procedures.
CLEANING AND INSPECTION

1. Clean inside of tire with dry rag.
2. If rim is dirty or corroded, clean with a stiff wire brush.
3. Inspect tire for wear and damage. Replace worn or damaged tires. See 1.8 TIRES AND WHEELS.

INSTALLATION

1. Damaged or leaking valve stems must be replaced.
2. Install and tighten fastener to 40-44 in-lbs (4-5 Nm).
3. Thoroughly lubricate rim flanges and both beads of tire with tire lubricant.
4. See Figure 2-29. Starting at the valve stem, start first bead into the rim well using a bead breaker machine. If no machine is available, work bead on as far as possible by hand. Use a tire tool to pry the remaining bead over rim flange.
5. Start 180° from valve stem hole and place second bead on rim. Work bead onto rim with tire tools, working toward valve in both directions.

WARNING

Only install original equipment (stock) tire valves and valve caps. A valve or valve and cap combination that is too long may interfere with (strike) adjacent components, damage the valve and cause rapid tire deflation. Rapid tire deflation could cause loss of control. These events could result in death or serious injury.

WARNING

Aftermarket valve caps that are heavier than the stock cap may have clearance at slow speeds; but, at high speed the valve/cap will be moved outward by centrifugal force. This outward movement could cause the valve/cap to strike the adjacent components, damage the valve and cause rapid tire deflation. Rapid tire deflation could cause loss of control. These events could result in death or serious injury.

WARNING

Do not inflate over 40 psi (275 kPa) to seat the beads. Inflating the tire beyond 40 psi (275 kPa) to seat the beads can cause the tire rim assembly to burst with force sufficient to cause death or serious injury. If the beads fail to seat to 40 psi (275 kPa), deflate and relubricate the bead and rim and reinflate to seat the beads, but do not exceed 40 psi (275 kPa).

6. Apply air to stem to seat beads on rim. It may be necessary to use a TIRE BEAD EXPANDER (Part No. HD-28700) on the tire until beads seal on rim.
Checking Tire Lateral Runout
1. See Figure 2-30. Turn wheel on axle and measure amount of displacement from a fixed point to tire sidewall.
2. Check tire tread for appropriate runout specification. See Table 2-9. If runout is more than specification, remove tire from rim.
3. Check rim bead side runout. See 2.7 CHECKING CAST RIM RUNOUT. Replace rims not meeting specifications.
4. Install tire and check again for tire tread lateral runout.

Checking Tire Radial Runout
1. See Figure 2-31. Turn wheel on axle and measure tread radial runout.
2. Check tire tread for appropriate runout specification. See Table 2-9. If runout is more than specification, remove tire from rim.
3. Check rim bead runout. See 2.7 CHECKING CAST RIM RUNOUT. Replace rims not meeting specifications.
4. Install tire and check tire tread radial runout again.

![Figure 2-30. Checking Tire Lateral Runout](image)

</table>
Wheel Balancing

Wheel balancing is recommended to improve handling and reduce vibration, especially at high road speeds.

In most cases, static balancing using WHEEL TRUING AND BALANCING STAND (Part No. HD-99500-80) will produce satisfactory results. However, dynamic balancing, utilizing a wheel spinner, can be used to produce finer tolerances for better high-speed handling characteristics. Follow the instructions supplied with the balance machine you are using.

NOTE
If the rear wheel on the XB9S will not fit on a stock dynamic spin balance shaft, use the Carlson wheel balance shaft (Part No. AF15).

WEIGHTS FOR CAST WHEELS

The maximum weight permissible to accomplish balance is:

- 1.0 oz. (28 g) total weight applied to the front wheel.
- 2.0 oz. (56 g) total weight applied to the rear wheel.

Wheels should be balanced to within 1/4 oz. (7 g) at 60 MPH (97 KM/H).

See Figure 2-32. Use only WHEEL WEIGHTS (Part No. 43692-94Y) which have special self-adhesive backings. Apply WHEEL WEIGHTS to the flat surface of the wheel rim.

1. Make sure that area of application is completely clean, dry and free of oil and grease.
2. Remove paper backing from weight. For additional adhesive strength, apply three drops of LOCTITE SUPERBONDER 420 to adhesive side of weight.
3. Locate a flat surface on the right side of the wheel rim and press weight firmly in place, holding for ten seconds.
4. Allow eight hours for adhesive to cure completely before using wheel.

NOTE
If wheel assembly is out of specification (1 oz. front, 2 oz. rear) rotate tire and rebalance until wheel is within specification.
REMOVAL

1. See Figure 2-33. Remove cotter pin (7) and discard.
2. Remove clevis pin (2).
3. Remove pedal fastener (5).
4. Remove shift brake pedal sleeve (4).
5. Remove pedal bushings (3).
6. Remove brake pedal (6).

INSTALLATION

1. See Figure 2-33. Install pedal bushings (3).
2. Install shift brake pedal sleeve (4).
3. Install brake pedal (6) using LOCTITE 272 and tighten fastener (5) to 22-24 ft-lbs (30-33 Nm).
4. Install clevis pin (2).
5. Install new cotter pin (7).
REMOVAL

NOTE
Steps 1 is not required for removing the master cylinder assembly from the handlebars. Do not disassemble master cylinder unless problems are experienced.

1. Drain brake fluid into a suitable container. Discard used fluid according to local laws.
   a. Install a length of plastic tubing over caliper bleeder valve. Place free end in a suitable container.
   b. Open bleeder valve (metric) about 1/2-turn.
   c. Pump brake hand lever to drain brake fluid.
   d. Tighten bleeder valve to 36-60 in-lbs (4-7 Nm).

CAUTION
Damaged banjo bolt seating surfaces will leak when reassembled. Prevent damage to seating surfaces by carefully removing brake line components.

2. See Figure 2-34. Remove the banjo bolt (13) (metric) and two copper washers (15) to disconnect brake line (14) from master cylinder (4). Discard copper washers.

3. Unplug terminal (12) to detach brake lamp switch (11).

   NOTE
   The individual parts of the brake lamp switch are not serviceable. Replace switch upon failure.

4. Remove mounting clamp fasteners (5) (metric) to detach master cylinder reservoir (4) from handlebar.

---

Figure 2-34. Front Brake Hand Lever Assembly

10. Brake switch fastener
11. Brake switch
12. Brake switch terminal
13. Banjo bolt (metric)
14. Brake line
15. Copper washers
16. Pivot bolt
DISASSEMBLY

Brake Hand Lever
1. See Figure 2-34. Remove pivot bolt nut (9) (metric) and pivot bolt (16) from hand lever pivot.
2. Detach front brake hand lever assembly (8) from hand lever pivot.
3. Detach front brake lamp switch (11) by removing the switch fastener (10).

Front Master Cylinder
1. See Figure 2-34. Remove master cylinder cover (2) by removing cylinder cover fasteners (1).
2. Discard excess brake fluid.
3. Remove rubber boot (7) and discard.
4. See Figure 2-35. Depress piston assembly (1) and remove internal circlip (2) and discard.
5. See Figure 2-34. Remove piston assembly (6) from front master cylinder reservoir (4) and discard.

CLEANING AND INSPECTION

WARNING

Clean brake system components using denatured alcohol. Do not use mineral-base cleaning solvents, such as gasoline or paint thinner. Use of mineral-base solvents causes deterioration of rubber parts that continues after assembly. This may result in improper brake operation which could result in death or serious injury.

1. Clean all parts with denatured alcohol or D.O.T. 4 BRAKE FLUID. Do not contaminate with mineral oil or other solvents. Wipe dry with a clean, lint free cloth. Blow out drilled passages and bore with a clean air supply. Do not use a wire or similar instrument to clean drilled passages in bottom of reservoir.
2. Inspect piston bore in master cylinder housing for scoring, pitting or corrosion. Replace housing if any of these conditions are found.
3. Inspect outlet port that mates with brake line fitting. As a critical sealing surface, replace housing if any scratches, dents or other damage is noted.

Figure 2-35. Piston Assembly in Master Cylinder
Front Master Cylinder

1. Obtain PISTON ASSEMBLY KIT.

2. See Figure 2-36. Assemble new piston components placing small end of spring (5) behind primary seal of piston (4).

3. Lubricate master cylinder body and piston seals with special lubricant found in the service parts kit.

4. See Figure 2-34. Insert piston assembly (6), spring first, into master cylinder reservoir (4).

5. See Figure 2-35. Secure piston assembly (1) with a new circlip (2).

6. See Figure 2-36. Install ridge on boot (1) into groove on piston (3).

Brake Hand Lever

1. See Figure 2-34. Lubricate pivot bolt (16) with LOCTITE ANTI-SEIZE.

2. Align hole in hand lever (8) with hole in hand lever pivot and install pivot bolt (16) through top of hand lever pivot and tighten to 80-120 in-lbs (9-14 Nm).
INSTALLATION

1. See Figure 2-34. Install front brake lamp switch (11).
   a. Install brake lamp switch (11) with switch fastener (10) and tighten to 7-10 in-lbs (0.8-1.0 Nm).
   b. Connect brake switch terminal (12) to brake lamp switch (11).
   c. Test switch action. Tang on switch must release when hand lever is moved.

2. Install master cylinder to handlebar by fastening clamp with fasteners and tighten to 80-90 in-lbs (9-10 Nm).

WARNING

Use only copper crush banjo washers (See Parts Catalog for Part No.) with D.O.T. 4 brake fluid. Earlier silver banjo washers are not compatible with D.O.T. 4 fluid and will not seal properly over time. Failure to comply may adversely affect braking ability and lead to brake failure which could result in death or serious injury.

WARNING

To avoid leakage, verify that banjo washers, banjo bolt, hydraulic brake line and master cylinder bore are completely clean.

3. See Figure 2-34. Connect brake line to master cylinder using two new copper washers (15) and banjo bolt (13) (metric) and tighten to 16-20 ft-lbs (22-27 Nm).

4. See Figure 2-37. Verify brake lamp switch wires are tight.

5. See Figure 2-34. Remove two master cylinder cover screws (1), cover (2) and cover gasket (3).

6. See Figure 2-38. With the master cylinder in a level position, add D.O.T. 4 BRAKE FLUID. Bring fluid level to within 1/8 in. (3.2 mm) of molded boss inside front master cylinder reservoir.

WARNING

Verify proper operation of the master cylinder relief port. A plugged or covered relief port can cause brake drag or lockup, which could result in loss of vehicle control which could result in death or serious injury.

7. Verify proper operation of the master cylinder relief port. Actuate the brake lever with the reservoir cover removed. A slight spurt of fluid will break the surface if all internal components are working properly.

8. Bleed brake system. See 1.7 BRAKE SYSTEM MAINTENANCE.

9. See Figure 2-34. Attach master cylinder cover (2) and cover gasket (3). Tighten two cover fasteners (1) to 9-13 in-lbs (1.0-1.5 Nm).

WARNING

Always test motorcycle brakes at low speed after servicing or bleeding system. To prevent death or serious injury, Buell recommends that all brake repairs be performed by a Buell dealer or other qualified technician.

10. Turn ignition key switch to ON. Apply brake hand lever to test brake lamp operation. Turn ignition key switch to OFF.
REMOVAL

1. Drain brake fluid into a suitable container. Discard of used fluid according to local laws.
   a. Install a length of plastic tubing over caliper bleeder valve. Place free end in a suitable container.
   b. Open bleeder valve (metric) about 1/2-turn.
   c. Pump brake hand lever to drain brake fluid.
   d. Tighten bleeder valve to 36-60 in-lbs (4-7 Nm).

2. Remove p-clamp attaching brake line to rear of right front module. See 2.40 FRONT WINDSCREEN/2.26 FRONT MODULES.

3. See Figure 2-39. Remove p-clamp (1) detaching brake line from right side of lower fork clamp.

CAUTION

Damaged banjo bolt seating surfaces will leak when reassembled. Prevent damage to seating surfaces by carefully removing brake line components.

4. See Figure 2-34. Remove master cylinder banjo bolt (13) (metric) and two copper washers (15) to disconnect brake line from master cylinder (4). Discard copper washers.

5. See Figure 2-39. Remove caliper banjo bolt (5) (metric), two copper washers and wire form (3) to disconnect brake line (2) from caliper. Discard copper washers.

6. Carefully inspect the brake line for dents, cuts, chaffing or other defects. Replace the brake line if any damage is noted.
To avoid leakage, verify that gaskets, banjo bolt, hydraulic brake line and master cylinder bore are completely clean.

1. See Figure 2-34. Connect brake line (14) to master cylinder (4) using two new copper washers (15) and a banjo bolt (13) (metric). Loosely install bolt into master cylinder.

2. Route the brake line from the master cylinder to the caliper. See D.1 HOSE AND WIRE ROUTING for front brake line routing.

**WARNING**

Use only copper crush banjo washers (See Parts Catalog for Part No.) with D.O.T. 4 brake fluid. Earlier silver banjo washers are not compatible with D.O.T. 4 fluid and will not seal properly over time. Failure to comply may adversely affect braking ability and lead to brake failure which could result in death or serious injury.

**CAUTION**

To avoid leakage, verify that gaskets, banjo bolt, hydraulic brake line and caliper bore are completely clean.

3. Install brake line to caliper.
   a. See Figure 2-40. Install new copper washer, brake line (2), new copper washer and wire form (3) onto banjo bolt (5).
   b. Finger tighten banjo bolt (5) onto front caliper being careful not to pinch wire form (3) while tightening, wire form should rotate around banjo bolt freely.
   c. Twist brake line (2) into wire form (3) spiral and clock wire form against bleeder valve (4).

4. Tighten p-clamp with fastener (1) on lower triple clamp to 36-60 in-lbs (4-7 Nm).

5. See Figure 2-34. Tighten master cylinder banjo bolt (13) (metric) to 16-20 ft-lbs (22-27 Nm).

6. See Figure 2-40. Tighten brake caliper banjo bolt (5) (metric) to 16-20 ft-lbs (22-27 Nm).

**WARNING**

Always test motorcycle brakes at low speed after servicing or bleeding system. To prevent death or serious injury, Buell recommends that all brake repairs be performed by a Buell dealer or other qualified mechanic.

7. Install bleeder valve if removed. Refill master cylinder and bleed brakes. See 1.7 BRAKE SYSTEM MAINTENANCE.

**WARNING**

Check for proper brake lamp operation before riding motorcycle. Visibility is a major concern for motorcyclists. Failure to have proper brake lamp operation could result in death or serious injury.

8. Turn ignition key switch to ON. Apply brake hand lever to test brake lamp operation. Turn ignition key switch to LOCK.
**REMOVAL**

1. Drain brake fluid into a suitable container. Discard used fluid according to local laws.
   a. Install a length of plastic tubing over caliper bleeder valve. Place free end in a suitable container.
   b. Open bleeder valve (metric) about 1/2-turn.
   c. Pump brake hand lever to drain brake fluid.
   d. Tighten bleeder valve to 36-60 in-lbs (4-7 Nm).

   **CAUTION**

   Damaged banjo bolt seating surfaces will leak when reassembled. Prevent damage to seating surfaces by carefully removing brake line components.

2. See Figure 2-41. Disconnect brake line at caliper. See 2.11 FRONT BRAKE LINE.

3. Remove caliper mounting fasteners (5).

4. Slide caliper down the rotor to clear fork lower and then remove off rotor.

**DISASSEMBLY**

1. See Figure 2-42. Remove pin hanger set (1), brake pads and caliper pad spring (2).

2. Split caliper by removing caliper fasteners (3).

3. See Figure 2-44. Remove and discard o-rings (8).

4. See Figure 2-43. Remove pistons using a BRAKE PISTON REMOVER (Part No. B-42887).

5. See Figure 2-44. Remove and discard top and bottom piston o-rings (6).
CLEANING AND INSPECTION

WARNING

Clean brake system components using denatured alcohol. Do not use mineral-base cleaning solvents, such as gasoline or paint thinner. Use of mineral-base solvents causes deterioration of rubber parts that continues after assembly. This may result in improper brake operation which could result in death or serious injury.

1. Clean all parts with denatured alcohol or D.O.T. 4 BRAKE FLUID. Do not contaminate with mineral oil or other solvents. Wipe dry with a clean, lint free cloth. Blow out drilled passages and bore with a clean air supply. Do not use a wire or similar instrument to clean drilled passages.

2. Carefully inspect all components. Replace any parts that appear damaged or worn. Do not hone caliper piston bore.

WARNING

Always replace brake pads in complete sets for correct brake operation. Never replace just one brake pad. Failure to install brake pads as a set could result in death or serious injury.

3. Inspect brake rotor and pads. See 1.7 BRAKE SYSTEM MAINTENANCE.

4. Check rotor surface. Replace if warped or badly scored. See Table 2-10.

Table 2-10. Front Rotor Runout

<table>
<thead>

</tbody>
</table>

ASSEMBLY

1. See Figure 2-44. Install pistons and o-rings.
   a. Lubricate new o-rings (6), pistons (5), and caliper piston bores with D.O.T. 4 BRAKE FLUID.
   b. Install two new o-rings (6) in grooves of each piston bore.
   c. Install pistons (5) in each piston bore.

2. Install new o-rings (8) between caliper halves.

3. Clamp caliper together with caliper fasteners (11) and tighten to 15-19 ft-lbs (20-26 Nm).

INSTALLATION

1. See Figure 2-44. Install brake pads (10).

2. Install pin hanger set (1) and tighten to 11-14 ft-lbs (15-19 Nm).

3. Rotate front fork counterclockwise and install caliper on caliper mount. Using LOCTITE 272, tighten fasteners (9) to 35-37 ft-lbs (47-50 Nm).

4. Rotate front fork/caliper clockwise and slide caliper onto rotor.

WARNING

Use only copper crush banjo washers (See Parts Catalog for Part No.) with D.O.T. 4 brake fluid. Earlier silver banjo washers are not compatible with D.O.T. 4 fluid and will not seal properly over time. Failure to comply may adversely affect braking ability and lead to brake failure which could result in death or serious injury.

5. Install brake line to caliper. See 2.11 FRONT BRAKE LINE.

6. Bleed front brakes. See BLEEDING BRAKES in 1.7 BRAKE SYSTEM MAINTENANCE.

WARNING

Check for proper brake lamp operation before riding motorcycle. Visibility is a major concern for motorcyclists. Failure to have proper brake lamp operation could result in death or serious injury.

7. Turn ignition key switch to ON. Apply brake hand lever to test brake lamp operation.
1. Pin hanger set
2. Brake bleeder
3. Bleeder cap
4. Caliper
5. Piston
6. Piston o-rings

9. Caliper mounting fasteners
10. Brake pads
11. Caliper fasteners

Figure 2-44. Front Caliper Assembly
REAR BRAKE MASTER CYLINDER 2.13

REMOVAL

1. See Figure 2-45. Drain brake fluid into a suitable container. Discard used fluid according to local laws.
   a. Install a length of plastic tubing over caliper bleeder valve. Place free end in a suitable container.
   b. Open bleeder valve (metric) about 1/2-turn.
   c. Pump brake foot pedal to drain brake fluid.
   d. Tighten bleeder valve to 36-60 in-lbs (4-7 Nm).

2. Remove brake pedal. See 2.9 BRAKE PEDAL.

3. Remove heel guard. See 2.30 FOOTPEG, HEEL GUARD AND MOUNT.

   CAUTION
   Damaged banjo bolt surfaces will leak when reassembled. Prevent damage to seating surfaces by carefully removing brake line components.

4. See Figure 2-46. Remove brake reservoir hose at master cylinder.

5. Remove seat. See 2.41 SEAT.
6. See Figure 2-47. Disconnect brake light connector located under the seat.

7. See Figure 2-48. Remove rear brake light switch (1) (metric) and two copper crush washers (3) to detach brake line (2) from master cylinder (4). Discard copper crush washers.

8. Remove right side rider footpeg mount. See 2.30 FOOT-PEG, HEEL GUARD AND MOUNT.

9. Remove fasteners (11) (metric) to detach master cylinder (4) from rider footpeg mount.

10. See Figure 2-49. Detach remote reservoir.
    a. Remove top clamp (2) on hose connected to master cylinder.
    b. Remove fastener (3) to detach reservoir (1) from frame if necessary.
DISASSEMBLY

1. See Figure 2-50. Slide rubber boot on rod assembly (3) away from master cylinder body (1).

2. Depress rod assembly (3) and remove internal circlip (2). Discard circlip.

3. Remove piston assembly (4) from master cylinder body (1).

4. Loosen adjuster locknut on the rod assembly (3).

5. Remove the clevis from the rod assembly (3).

**NOTE**
Do not disassemble master cylinder unless problems are experienced. Discard all seals during the disassembly procedure. Install a complete rebuild kit upon assembly.

CLEANING AND INSPECTION

**WARNING**
Clean brake system components using denatured alcohol. Do not use mineral-base cleaning solvents, such as gasoline or paint thinner. Use of mineral-base solvents causes deterioration of rubber parts that continues after assembly. This may result in improper brake operation which could result in death or serious injury.

1. Thoroughly clean master cylinder and all brake system components. Stand master cylinder on wooden block or towel to protect seating surfaces.
   a. Examine walls of master cylinder reservoir for scratches and grooves. Replace if damaged.
   b. Verify that vent holes on master cylinder are completely open and free of dirt or debris.

2. Inspect boot on front of master cylinder for cuts, tears or general deterioration. Replace if necessary.

ASSEMBLY

1. Obtain PISTON ASSEMBLY KIT.

2. See Figure 2-50. Assemble new piston components placing small end of spring behind primary seal of piston (4).

3. Lubricate master cylinder body (1) and piston seals (5) with D.O.T. 4 BRAKE FLUID.

4. Place round side of rod assembly (3) over piston. Depress piston (4) into master cylinder body (1) and secure with a new circlip (2).

**WARNING**
Circlip must be snapped into the groove of the master cylinder body. If the circlip is not properly installed, improper brake operation could result in death or serious injury.

5. Tuck rubber boot on rod assembly (3) into master cylinder body (1).
INSTALLATION

1. See Figure 2-48. Install master cylinder (4) onto footpeg mount with fasteners (11). Tighten to 72-96 in-lbs (8-11 Nm).
2. Install rear brake switch (1), brake line (2) and new copper crush washers (3). Tighten to 16-20 ft-lbs (22-27 Nm).
3. Install footpeg mount to frame. See 2.30 FOOTPEG, HEEL GUARD AND MOUNT.

**WARNING**

Use only copper crush banjo washers (See Parts Catalog for Part No.) with D.O.T. 4 brake fluid. Earlier silver banjo washers are not compatible with D.O.T. 4 fluid and will not seal properly over time. Failure to comply may adversely affect braking ability and lead to brake failure which could result in death or serious injury.

**CAUTION**

To avoid leakage after assembly, verify that banjo washers, banjo bolt, hydraulic brake line and bore of master cylinder are completely clean.

4. See Figure 2-49. Connect remote reservoir.
   a. If removed, attach remote reservoir (1) to frame using fastener and washer (3). Tighten to 48-72 in-lbs (5.4-8.1 Nm).
   b. Attach hose (3) to rear brake reservoir using clamp.
5. See Figure 2-47. Connect brake line switch connector under seat.
6. Install heel guard. See 2.30 FOOTPEG, HEEL GUARD AND MOUNT.
7. Install rear brake pedal. See 2.9 BRAKE PEDAL.
8. Adjust rear brake pedal. See BRAKE PEDAL ADJUSTMENT in 1.7 BRAKE SYSTEM MAINTENANCE.
9. Install master cylinder to brake pedal. See 2.9 BRAKE PEDAL.

**WARNING**

Always test motorcycle brakes at low speed after servicing or bleeding system. To prevent death or serious injury, Buell recommends that all brake repairs be performed by a Buell dealer or other qualified mechanic.

10. Add brake fluid and bleed brake system. See 1.7 BRAKE SYSTEM MAINTENANCE.

**WARNING**

Check for proper brake lamp operation before riding motorcycle. Visibility is a major concern for motorcyclists. Failure to have proper brake lamp operation could result in death or serious injury.

**WARNING**

After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

11. Install seat. See 2.41 SEAT.
REMOVAL

1. Remove seat. See 2.41 SEAT.

**WARNING**

To protect against accidental start-up of vehicle and possible personal injury, disconnect the negative battery cable before proceeding. Inadequate safety precautions could cause a battery explosion, which could result in death or serious injury.

2. Disconnect battery by unthreading fastener removing negative cable (black) from battery first. See 1.5 BATTERY MAINTENANCE.

3. See Figure 2-51. Disconnect brake line connector from under seat in the front of the battery.

4. Remove right side heel guard. See 2.30 FOOTPEG, HEEL GUARD AND MOUNT.

5. Drain brake fluid into a suitable container. Discard used fluid according to local laws.
   a. Install a length of plastic tubing over caliper bleeder valve. Place free end in a suitable container.
   b. Open bleeder valve (metric) about 1/2-turn.
   c. Pump brake foot pedal to drain brake fluid.
   d. Tighten bleeder valve to 36-60 in-lbs (4-7 Nm).

6. See Figure 2-52. Remove p-clamp (3) and wire form (2) securing brake line (1) to the left side of swingarm.

**CAUTION**

Damaged banjo bolt seating surfaces will leak when reassembled. Prevent damage to seating surfaces by carefully removing brake line components.

7. Remove banjo bolt (4) from rear caliper. Discard copper washers.

8. See Figure 2-53. Remove brake line switch/banjo bolt from rear master cylinder. Discard copper washer.

9. Remove brake line from motorcycle.
INSTALLATION

1. See Figure 2-53. Install brake line switch/banjo bolt with new copper washers to the master cylinder. Tighten to 16-20 ft-lbs (22-27 Nm).

   NOTE
   Tighten the right side banjo bolt with FLARE NUT SOCKET tool (SNAP-ON Part No. FRXM14) or a crowsfoot.

   WARNING
   Use only copper crush banjo washers (See Parts Catalog for Part No.) with D.O.T. 4 brake fluid. Earlier silver banjo washers are not compatible with D.O.T. 4 fluid and will not seal properly over time. Failure to comply may adversely affect braking ability and lead to brake failure which could result in death or serious injury.

2. Install brake line switch/banjo bolt and new copper washers to rear caliper. Tighten to 16-20 ft-lbs (22-27 Nm).

3. See Figure 2-52. Secure brake line (1) to left side of swingarm with p-clamp (3), wire form (2), and tighten to 36-60 in-lbs (4-7 Nm). See D.1 HOSE AND WIRE ROUTING for brake line routing.

4. See Figure 2-54. Connect brake line switch connector underneath seat. See D.1 HOSE AND WIRE ROUTING for brake line routing.

5. Install right heel guard. See 2.30 FOOTPEG, HEEL GUARD AND MOUNT.

6. Bleed brakes. See BLEEDING BRAKES in 1.7 BRAKE SYSTEM MAINTENANCE.

7. Install battery by threading positive cable (red) into threaded hole first tightening to 72-96 in-lbs (8-11 Nm). See 1.5 BATTERY MAINTENANCE.

   WARNING
   Always connect the positive battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

8. Install seat. See 2.41 SEAT.

   WARNING
   After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

9. Turn ignition key ON, depress rear brake pedal and check for proper brake light operation.

   WARNING
   Check for proper brake lamp operation before riding motorcycle. Visibility is a major concern for motorcyclists. Failure to have proper brake lamp operation could result in death or serious injury.

10. Test ride motorcycle and check for proper brake operation.

   WARNING
   After completing repairs or bleeding the system, always test motorcycle brakes at low speed. If brakes are not operating properly or braking efficiency is poor, testing at high speeds could result in death or serious injury.
REAR BRAKE CALIPER

REMOVAL

NOTE
Steps 1 and 2 are not required for detaching caliper from rotor. Drain fluid only when disassembling caliper.

CAUTION
Damaged banjo bolt seating surfaces will leak when reassembled. Prevent damage to seating surfaces by carefully removing brake line components.
1. Drain brake fluid into a suitable container. Discard used fluid according to local laws.
   a. Install a length of plastic tubing over caliper bleeder valve. Place free end in a suitable container.
   b. Open bleeder valve (metric) about 1/2-turn.
   c. Pump brake foot pedal to drain brake fluid.
   d. Tighten bleeder valve to 36-60 in-lbs (4-7 Nm).
2. Remove banjo bolt connecting brake line to rear caliper. See 2.14 REAR BRAKE LINE.

DISASSEMBLY

1. See Figure 2-54. Remove pin plug (5) and pad hanger (metric) to free brake pads.

   Figure 2-54. Rear Brake Caliper

   1. Brake line
   2. Banjo bolt (metric)
   3. Copper washers (2)
   4. Bleeder valve (metric)
   5. Pin plug
   6. Small caliper fastener
   7. Larger caliper fastener
   8. Caliper mounting fasteners

2. See Figure 2-55. Remove spring clip (1).

   Figure 2-55. Brake Pads

   1. Clip
   2. Pin plug and pad hanger (metric)
   3. Brake pads (2)

3. See Figure 2-56. Remove caliper mounting fasteners (6 and 7).

   Figure 2-56. Removing Rear Brake Caliper Piston

   1. Brake caliper piston remover
   2. Adaptor
   3. Piston

3. See Figure 2-56. Remove piston (3) using BRAKE CALIPER PISTON REMOVER (1) (Part No. B-42887) with adaptor (2).

4. Remove two o-rings from groove in caliper bore and discard.
CLEANING AND INSPECTION

WARNING

Clean brake system components using denatured alcohol. Do not use mineral-base cleaning solvents, such as gasoline or paint thinner. Use of mineral-base solvents causes deterioration of rubber parts that continues after assembly. This may result in improper brake operation which could result in death or serious injury.

1. Clean all parts with denatured alcohol or D.O.T. 4 BRAKE FLUID. Do not contaminate with mineral oil or other solvents. Wipe dry with a clean, lint free cloth. Blow out drilled passages and bore with a clean air supply. Do not use a wire or similar instrument to clean drilled passages.

2. Carefully inspect all components. Replace any parts that appear damaged or worn. Do not hone caliper piston bore.

3. Inspect brake rotor.
   a. Measure rotor thickness. Replace if minimum thickness is less than 0.18 in. (4.5 mm).
   b. Check rotor surface. Replace if warped or badly scored. See Table 2-11.

Table 2-11. Rear Rotor Runout

<table>
<thead>
<tr>
<th>RUNOUT</th>
<th>IN.</th>
<th>MM</th>
</tr>
</thead>
<tbody>
<tr>
<td>Radial</td>
<td>0.0177</td>
<td>0.45</td>
</tr>
<tr>
<td>Lateral</td>
<td>0.0154</td>
<td>0.39</td>
</tr>
</tbody>
</table>

WARNING

Always replace brake pads in complete sets for correct brake operation. Never replace just one brake pad. Failure to install brake pads as a set could result in death or serious injury.

4. Inspect brake pads for damage or excessive wear. Replace both pads as a set if the friction material of either pad is worn to 0.04 in. (1.0 mm) or less.

ASSEMBLY

1. See Figure 2-55. Place clip (1) inside caliper body as shown.

   NOTE

To ensure proper brake pad-to-brake rotor clearance when the caliper is installed, piston must be pressed all the way into the bore whenever new brake pads are used.

2. Install pistons and o-rings.
   a. Apply a light coat of D.O.T. 4 BRAKE FLUID to o-rings, piston and caliper piston bore.
   b. Place two new o-rings inside grooves of piston bore.
   c. Install piston inside caliper body.

3. See Figure 2-55. Install brake pads (3) using pad hanger and pin plug (2).
   a. Install pad hanger pin (metric). Tighten to 11-14 ft-lbs (15-19 Nm).
   b. Install pin plug. Tighten to 22-26 in-lbs (2-3 Nm).

4. Install a new bleeder valve (metric) if necessary and tighten to 36-60 in-lbs (4-7 Nm).
INSTALLATION

1. See Figure 2-57. Install brake pad retainer (1) if removed.

2. See Figure 2-54. Install caliper assembly on caliper mount. Brake pad surfaces must face rear brake rotor.
   a. Install large caliper screw (7) (metric) tightening to 18-21 ft-lbs (24-28 Nm).
   b. Install small caliper screw (6) (metric) tightening to 14-18 ft-lbs (19-24 Nm).
   c. Install caliper carrier onto swingarm tightening caliper carrier fasteners (8) to 24-26 ft-lbs (33-35 Nm).

3. See Figure 2-54. Connect brake line (1) to caliper using two new copper washers (3) and banjo bolt (2) (metric). Tighten to 16-20 ft-lbs (22-27).

4. Depress rear brake pedal several times to set brake pads to proper position within caliper. Bleed brake system.

5. See Figure 2-58. Verify proper fluid level in reservoir.

6. Turn ignition key switch to ON. Apply brake pedal to test brake lamp operation. Turn ignition key switch to LOCK.

WARNING
Use only copper crush banjo washers (See Parts Catalog for Part No.) with D.O.T. 4 brake fluid. Earlier silver banjo washers are not compatible with D.O.T. 4 fluid and will not seal properly over time. Failure to comply may adversely affect braking ability and lead to brake failure which could result in death or serious injury.

CAUTION
To avoid leakage, verify that gaskets, banjo bolt, hydraulic brake line and caliper bore are completely clean.

NOTE
Avoid making hard stops for the first 100 miles (160 km) to allow new brake pads to “wear in” properly with the brake rotor.
GENERAL

The front fork consists of two telescoping outer tube/inner slider assemblies. Each assembly has an internal compression spring which supports the forward weight of the vehicle and rider. The compression spring extends and retracts to cushion the ride over rough or irregular road surfaces. An oil filled damping mechanism controls the telescoping action of each tube/slider assembly.

See 1.12 SUSPENSION DAMPING ADJUSTMENTS for more information.

REMOVAL

1. Remove front fender. See 2.32 FENDERS.
2. Remove front wheel. See 2.5 FRONT WHEEL.
3. Remove caliper mounting fasteners. See 2.12 FRONT BRAKE CALPER.
4. See Figure 2-59. Loosen upper and lower fork clamp pinch fasteners (1, 4).
5. See Figure 2-60. Remove fork from upper fork clamp and slide the stopper ring up and over the top of the fork.
6. See Figure 2-59. Remove fork from lower fork clamp (3).
7. Repeat 4 through 6 on opposite side.

Figure 2-59. Upper and Lower Fork Clamp Assembly

1. Screw, pinch fastener (3 - upper)
2. Triple clamp, upper
3. Triple clamp assembly, lower
4. Screw, pinch fastener (4 - lower)

Figure 2-60. Stopper Ring

4. See Figure 2-59. Loosen upper and lower fork clamp pinch fasteners (1, 4).
NOTE
Record rider suspension settings before disassembly.

1. Remove front fork. See REMOVAL in 2.16 FRONT FORK.

2. See Figure 2-61. Clamp the FORK TUBE HOLDER TOOL (1) (Part No. HD-41177) in a vise and install the upper part of the front fork in the holding tool.

3. Remove snap ring (2).

4. See Figure 2-62. Remove preload adjuster by turning counterclockwise.

   NOTE
   After fully unthreading preload adjuster, gently pull on adjuster.

5. See Figure 2-63. Remove fork cap from outer tube.
6. See Figure 2-64. Move the fork assembly from the holding tool and compress fork in the FORK SPRING COMPRESSION TOOL.

7. See Figure 2-65. Hold damper rod assembly (3) and remove fork cap (1).

**NOTE**
Careful not to damage preload pins (2) while holding damper rod assembly (3).

8. Remove preload washer (4) and slider piston (5).

9. See Figure 2-64. Uncompress fork and remove from FORK SPRING COMPRESSION TOOL.
1. Preload adjuster
2. Preload adjuster o-rings
3. Fork cap
4. Fork cap o-ring
5. Preload washer
6. Slider piston
7. Inner slider piston o-ring
8. Snap ring
9. Rebound adjuster assembly
10. Damper locknut
11. Damper rod assembly
12. Centering plate
13. Ceiling washer
14. Center bolt
15. Collar
16. Spring
17. Spring joint
18. Outer tube
19. Stopper ring
20. Reflector assembly
21. Slide bushing
22. Guide bushing
23. Seal spacer
24. Oil seal
25. Oil seal stopper ring
26. Dust seal
27. Slider fork

Figure 2-66. Front Fork Assembly
10. See Figure 2-66. Over drain pan, spring collar (15), remove spring (16) and drain fork oil.

11. Drain remaining fork oil by pumping the damping rod (11) approximately 8 to 10 times or until damping rod moves freely.

12. Clamp fork upside down in the FORK TUBE HOLDER TOOL (Part No. HD-41177) over drain pan allowing fork oil to drain.

**NOTE**

Be careful not to drop damping rod assembly into oil pan when removing center bolt.

13. Remove center bolt (14) to release damping rod assembly (11).

14. Remove centering plate (12) from dampening rod (11).

**WARNING**

Be careful not to scratch the slider fork or the outer tube. Improperly operating forks may lead to a loss of control which could result in death or serious injury.

15. Remove dust seal (26) to access oil seal stopper ring (25).

16. Release the oil seal stopper ring (25) out from the outer tube with a small pry tool.

17. Using a slide hammer action, remove the slider fork (27) from the outer tube (18).

18. Remove the slide bushing (21) from slider fork by prying the slide bushing at the split.

**NOTE**

Careful not to over expand slide bushing.

19. Remove guide bushing (22), seal spacer (23), oil seal (24), stopper ring (25) and dust seal (26).

**Damper Rod Disassembly**

**IMPORTANT NOTES**

- See Figure 2-66. Disassembly of damper rod is not required unless damper locknut (10) has been moved. If damper rod needs servicing refer to the Parts Catalog for kit information.

- If damper locknut has been moved, proceed with the following disassembly and assembly procedures for setting the correct range of motion.

1. See Figure 2-66. Lightly turn the rebound adjuster screw on top of the rebound adjuster assembly (9) counter clockwise till it stops.

2. Holding the damper locknut (10), unscrew the rebound adjuster assembly (9) and remove from damper rod assembly (11).

3. Remove damper locknut (10) from damper rod assembly (11).

**CLEANING AND INSPECTION**

1. Thoroughly clean and inspect all parts. Replace any parts that are bent, broken or damaged.

2. See Figure 2-66. Check the slider fork (27) and outer tube (18) for score marks, scratches and excessive or abnormal wear. Replace if worn or damaged.

3. Check the slide bushing (21) and the guide bushing (22) for excessive wear or scratches. Replace if damaged or worn.

4. Replace the stopper ring (19) if distorted.

5. Measure spring (16) free length. Replace springs shorter than service wear limit of 9.13 in. (232 mm).

6. See Figure 2-67. Measure slider fork runout. Replace pipe if runout exceeds the service wear limit of 0.008 in. (0.2 mm).

**Figure 2-67. Slider fork Runout**
**Damper Rod Assembly**

*Note*

*Skip to fork assembly if damper rod assembly was not disassembled.*

1. See Figure 2-66. Fully thread the damper rod locknut (10) on to damper rod (11) clockwise till it lightly bottoms.

2. Adjust rebound assembly for proper range of motion.
   a. Lightly turn the rebound adjuster screw on top of the rebound adjuster assembly (9) counter clockwise till it stops.
   b. Turn the rebound adjuster screw three full turns clockwise.

3. Fully thread rebound adjuster assembly (9) onto the damper rod assembly (11) until it lightly bottoms. Do not tighten.

4. Thread the damper locknut (10) until bottoms lightly on the rebound adjuster assembly. Do not tighten.

5. Turning the rebound adjuster screw (9) counter clockwise three full turns or until stops.

6. See Figure 2-66. Tighten the damper locknut (10) to 22-30 ft-lbs (30-40 Nm).

7. Repeat for other fork assembly.

---

**Fork Assembly**

1. See Figure 2-66. Wrap the end of the slider fork (27) and the slide bushing channel with tape to avoid damaging the oil seal lip when installing.

2. Install a new dust seal (26) and stopper ring (25) onto the slider fork (27).

3. Coat the sealing lips of the new oil seal (24) with fork oil or sealing grease and install onto the slider fork with its marked side facing the dust seal (26).

4. Remove the tape from the slider fork end.

5. Install the seal spacer (23), the guide bushing (22) and the slide bushing (21) onto the slider fork (27).

6. Coat the slide bushing (21) and the guide bushing (22) with fork oil.

---

**CAUTION**

The outer tube can move freely up and down on the slider fork. Always hold both the slider fork and outer tube to prevent damage to bushings and seals.

---

**Figure 2-68. Rebound Assembly and Fork Cap Assembly**

1. Fork cap assembly
2. Rebound assembly

**Figure 2-69. Fork Seal Driver (B-43721)**

7. See Figure 2-66. Drive the guide bushing (22) with the seal spacer (23) and oil seal (24) into position in the outer tube using a FORK SEAL DRIVER (Part No. B-43721). See Figure 2-69.

8. Install the oil seal stopper ring (25) and a new dust seal (26).

9. Place the fork in the FORK TUBE HOLDER TOOL (Part No. HD-41177) and clamp into vise horizontally.

10. See Figure 2-66. Install the centering plate (12) onto the damper assembly (11) and insert the damper assembly into the slider fork (27).

11. Replace the sealing washer (13) and center bolt (14) (metric). Tighten the center bolt to 22-30 ft-lbs (30-40 Nm).
12. Move the front fork and the FORK TUBE HOLDER TOOL in the vise from the horizontal position to the vertical.

NOTES

● The recommended fork oil is hydraulic fork oil Type “E”.
● Use only TYPE E FORK OIL (Part No. HD-99884-80).

13. Pour 7 oz. (204 cc) into the fork pipe.
14. Pump the damper rod approximately 12 to 15 times or until resistance is felt.
15. Place the damper rod in the fully bottomed position and compress fork completely.
16. Pour 7 oz. (204 cc) more fork oil into the slider fork.
17. See Figure 2-70. Adjust fork oil level with FRONT FORK OIL LEVEL GAUGE (Part No. B-59000A) so that it is 4.6 in. (118 mm) from the top of the fork tube.
18. See Figure 2-66. Install spring (16) and collar (15).
19. Move fork assembly from holding tool to the FORK SPRING COMPRESSION TOOL.
20. See Figure 2-65. Install preload washer (4) and slider piston (5).
21. Hold damper rod assembly (3) and install fork cap (1) from damper rod assembly (3) tightening to 22-30 ft-lbs (30-40 Nm).

NOTE
See Figure 2-65. Careful not to damage preload pins (2) while holding damper rod assembly (3).

22. Apply fork oil or light grease to o-rings on preload adjuster and install preload adjuster (3).
23. Install snap ring (2).
INSTALLATION

1. See Figure 2-60. Install one front fork assembly into lower fork clamp.
2. Slide the stopper ring over top of fork assembly and into groove.

WARNING

Carefully install the fork into the upper fork clamp. Forcing the fork into the upper fork clamp could move the stopper ring out of the groove which will not allow the correct upper fork clamp load resulting in possible loss of control of the motorcycle and could result in death or serious injury.

3. Install fork assembly into upper fork clamp.

WARNING

Both forks should display the same number of alignment lines. Forks that are not properly aligned may lead to a loss of control which could result in death or serious injury.

4. See Figure 2-71. Position fork with alignment lines (4) visible and reflector facing to the side and tighten the lower fork clamp.
5. Repeat step 1 through 4 on second front fork.
6. Temporarily install front axle to the fork assemblies to verify correct alignment.
7. Use LOCTITE 272 on upper fork clamp fasteners and tighten to 17-19 ft-lbs (23-26 Nm).
8. Use LOCTITE 272 on lower fork clamp fasteners and tighten to 13-15 ft-lbs (18-20 Nm).
9. Repeat torque sequence in steps 7 and 8.
10. Install front brake caliper onto caliper mount. See 2.12 FRONT BRAKE CALIPER.
11. Install front wheel. See 2.5 FRONT WHEEL.
12. Install front fender. See 2.32 FENDERS.
13. Check headlamp alignment. See 1.18 HEADLIGHTS.
14. Adjust front forks suspension to rider preferences. See 1.12 SUSPENSION DAMPING ADJUSTMENTS.
REMOVAL

1. Place a scissor jack under jacking point and raise front wheel off ground. For location of jacking point see 2.29 EXHAUST SYSTEM.
2. Remove handlebars. See 2.27 HANDLEBARS.
3. Remove front modules. See 2.26 FRONT Modules.
4. Remove front fork assemblies. See 2.16 FRONT FORK.
5. See Figure 2-72. Remove steering stem pinch fastener (2).
6. See Figure 2-72. Hold or brace the lower fork clamp and remove steering stem capnut (1).
7. Remove the upper fork clamp (4).
8. Remove the lower fork clamp (6).
9. If steering head bearings need replacing, see 2.18 STEERING HEAD BEARINGS.

Figure 2-72. Steering Stem Assembly
1. See Figure 2-72. Install the lower fork clamp (6) into the steering stem bore and install the upper fork clamp (4).

2. Install steering stem capnut (1). Tighten but do not torque.

WARNING

Carefully install the fork into the upper fork clamp. Forcing the fork into the upper fork clamp could move the stopper ring out of the groove which will not allow the correct clamp load causing a possible loss of control of the motorcycle which could result in death or serious injury.

3. Install one front fork assembly into lower fork clamp (6).

4. See Figure 2-66. Slide the stopper ring (19) over top of fork assembly and into groove.

5. Install fork assembly into upper fork clamp. Tighten but do not torque lower fork clamp pinch fasteners.

6. Repeat previous two steps on second fork assembly.

7. Tighten steering stem capnut to 38-42 ft-lbs (52-57 Nm).

8. Install steering stem pinch bolt applying LOCTITE 272 and tightening to 17-19 ft-lbs (23-26 Nm).

9. See Figure 2-71. Position both forks with same number alignment lines (4) visible and reflectors facing to the sides. Do not tighten.

10. Use LOCTITE 272 on upper fork clamp fasteners and tighten to 17-19 ft-lbs (23-26 Nm).

11. Use LOCTITE 272 on lower fork clamp fasteners and tighten to 13-15 ft-lbs (18-20 Nm).

12. Repeat torque sequence in steps 10 and 11 to verify proper clamp load.

13. Install front modules. See 2.26 FRONT MODULES.

14. Install handlebars. See 2.27 HANDLEBARS.
REMOVAL

1. Place a scissor jack under jacking point and raise front wheel off ground. For location of jacking point see 2.29 EXHAUST SYSTEM.

2. Remove brake lever housing. See 2.10 FRONT BRAKE MASTER CYLINDER AND HAND LEVER.

3. Remove front forks, lower fork clamp, brake and wheel as front-end assembly.
   a. See Figure 2-72. Loosen steering stem pinch fastener (2) and upper and lower fork clamp pinch fasteners (3, 7).
   b. Brace wheel while removing steering stem capnut fastener (1).
   c. Remove upper fork clamp (4) and front-end assembly which includes front wheel, steering stem/lower fork clamp.

4. Remove upper and lower steering head bearings (5).
   a. See Figure 2-73. Locate notches inside steering head stem bore (upper bearing removed for clarity).
   b. Place a suitable tool in the notches of the steering stem bore and remove upper and lower steering head bearings.

   **NOTE**
   Discard steering head bearings and replace with new. Steering head bearings are not reusable.

INSTALLATION

   **NOTE**
   For easier installation of bearing, lubricate the outer bearing with engine oil prior to installing into steering stem bore.

1. See Figure 2-74. Install new upper and lower steering head bearings into the steering stem using STEERING HEAD BEARING RACE INSTALLER (Part No. HD-39302), and the STEERING HEAD BEARING INSTALLER (Part No. B-45521).
2. See Figure 2-76. Sparingly apply EXTREME PRESSURE LUBRICANT (Part No. J-23444-A) to the threads of the forcing screw (1) from the STEERING HEAD BEARING RACE INSTALLER (Part No. HD-39302), to prolong service life and ensure smooth operation. Insert the forcing screw (1) through the STEERING HEAD BEARING INSTALLATION TOOL (Part No. B-45521) (2).

**NOTE**

*For ease of steering head bearing installation, lubricate the outside of the steering head bearings.*

3. See Figure 76. Place the lower bearing (3) onto the forcing screw (1), with the inner race lip pointing away from the steering head.

4. Place the STEERING HEAD BEARING INSTALLATION TOOL (Part No. B-45521) (2) onto the forcing screw, with the shoulder into the bearing bore.

5. Install the bearing (4), washer (5) and nut (6) from the STEERING HEAD BEARING RACE INSTALLER (Part No. HD-39302) onto the forcing screw (1).

6. Tighten the nut (6) by hand, until both bearings are started into the bores in the steering head.

7. See Figure 2-77. Hold the forcing screw while tightening the nut to draw the bearings into the steering head. Continue tightening until both bearings are fully seated.

8. Visually check to make sure the bearings are completely seated against the shoulders in the steering head.

9. Install forks, front wheel, and lower fork clamp/steering stem as an assembly.

10. Install upper fork clamp.

11. Tighten steering stem capnut to 38-42 ft-lbs (52-57 Nm).

12. Use LOCTITE 272 on steering stem pinch fastener and tighten to 17-19 ft-lbs (23-26 Nm).
**GENERAL**

The swingarm also serves as the oil tank on the Buell XB9S. For information on the swingarm function as the oil tank, see 3.8 LUBRICATION SYSTEM.

The swingarm features a removable brace on the right side to allow drive belt replacement. Sealed bearings eliminate the need for preload adjustment.

**REMOVAL**

**Brace**

**CAUTION**

Before removing swingarm brace, always relieve belt tension first. Removing swingarm brace without releasing tension will cause swingarm brace damage.

1. Remove right side rider footpeg mount. See 2.30 FOOTPEG, HEEL GUARD AND MOUNT.
2. Remove right side passenger footpeg mount. See 2.30 FOOTPEG, HEEL GUARD AND MOUNT.
3. Remove left side passenger footpeg mount. See 2.30 FOOTPEG, HEEL GUARD AND MOUNT.
4. See Figure 2-78. Loosen rear axle pinch fastener (2).
5. Loosen rear axle (1) approximately 15 rotations to allow partial tension to be removed from rear drive system.
6. See Figure 2-79. Remove upper belt guard (1) by removing fasteners (2).

**NOTE**

The upper belt guard is attached to the swingarm brace and can not be removed from vehicle at this time.

13. Swingarm brace
14. Rear axle pinch fastener

Figure 2-80. Swingarm Assembly

7. See Figure 2-80. Remove swingarm brace mounting fasteners (12) and swingarm brace (13).
8. See Figure 2-79. Remove belt guard spacer (3).
9. Remove swingarm brace.

Swingarm

1. Remove seat. See 2.41 SEAT.

⚠️ WARNING

To protect against accidental start-up of vehicle and possible personal injury, disconnect the negative battery cable before proceeding. Inadequate safety precautions could cause a battery explosion, which could result in death or serious injury.

2. Disconnect battery by unthreading fasteners removing negative cable (black) from battery first. See 1.5 BATTERY MAINTENANCE.

3. See Figure 2-80. Remove oil drain plug (9) and drain oil from swingarm. See Draining Oil in 1.6 ENGINE LUBRICATION SYSTEM.

4. Remove rear wheel. See 2.6 REAR WHEEL.

5. Remove three oil lines from swingarm fittings. See 3.9 OIL HOSE ROUTING AND OIL RESERVOIR.

6. Remove p-clamp and washer that secures rear brake line to swingarm.

7. See Figure 2-86. Remove lower shock absorber mounting fastener (7) and spacer from shock absorber and swingarm.

8. See Figure 2-80. Loosen pivot shaft pinch fastener (7).

9. Remove pivot shaft (10) with a special 7/8 in. hex tool located in tool kit.
DISASSEMBLY

CAUTION
Carefully mark all bearing components as they are removed so that they may be returned to their original locations. Do not intermix bearing components.

Brace
Remove upper belt guard assembly. See 2.33 BELT GUARDS.

Swingarm
1. See Figure 2-81. Remove oil line fittings from swingarm. See Table 2-12.

2. See Figure 2-80. Remove swingarm bearings (5, 9) using slide hammer (SNAP-ON Part No. CJ1275 or equivalent) and 3/4 in. bearing remover and spacer.

3. Remove shock mount bushings (3) and sleeve.

4. Remove rear fender. See 2.32 FENDERS.

NOTE
See Figure 2-80. Remove swingarm bearings (5, 9) only if replacement is required. The complete bearing assembly must be replaced as a unit when replacement is necessary. Do not intermix bearing components.

CLEANING AND INSPECTION

WARNING
Compressed air can pierce the skin and cause injury. Never use your hand to check for leaks or to determine air flow rates. Wear safety glasses to shield your eyes from flying dirt and debris. Failure to comply could result in death or serious injury.

1. Thoroughly clean all components in solvent. Blow dry with compressed air.

2. Carefully inspect all bearing components for wear and/or corrosion. Replace complete bearing assembly if any component is damaged.

3. Check that swingarm is not bent or twisted. Replace if damaged.

ASSEMBLY

Brace
See Figure 2-79. Install new shock mount bushings (3).

Swingarm
1. See Figure 2-80. Install new shock mount bushings (3).

2. Install new bearings (5, 9) and spacer (4) with BEARING INSTALLER (Part No. HD44060) by lightly seating spacer.

NOTE
Swingarm bearings should be replaced as a unit. Do not intermix components. Mark all components so they may be correctly installed.

3. See Figure 2-81. Install oil line fittings on swingarm. Tighten to 29-31 ft-lbs (39-42 Nm). See 3.9 OIL HOSE ROUTING AND OIL RESERVOIR.

4. See Figure 2-80. Install drain plug (8). Tighten to 29-31 ft-lbs (39-42 Nm).

2. See Figure 2-80. Remove swingarm bearings (5, 9) using slide hammer (SNAP-ON Part No. CJ1275 or equivalent) and 3/4 in. bearing remover and spacer.

3. Remove shock mount bushings (3) and sleeve.

4. Remove rear fender. See 2.32 FENDERS.
INSTALLATION

Swingarm

1. See Figure 2-80. Align swingarm (1) in pivot of engine crankcase (6).
2. Install pivot shaft (10) with a special 7/8 in. hex tool located in tool kit, ANTI-SEIZE and tighten to 24-26 ft-lbs (32-35 Nm).
3. Tighten pivot shaft pinch fastener (7) to 17-19 ft-lbs (23-26 Nm).
4. See Figure 2-86. Install lower shock absorber mounting fastener (7) and spacer from shock absorber and swing-arm and tighten to 15-17 ft-lbs (20.3-23 Nm).
5. Install p-clamp and washer that secures rear brake line to swingarm and tighten to 36-60 in-lbs (4-7 Nm).
6. Install three oil lines from swingarm fittings. See 3.9 OIL HOSE ROUTING AND OIL RESERVOIR.
7. Install rear wheel. See 2.6 REAR WHEEL.

NOTE

Installing the rear wheel will include installation of the belt drive system. See 8.5 DRIVE BELT SYSTEM.

8. Fill motorcycle with recommended oil. See 1.6 ENGINE LUBRICATION SYSTEM.

Brace

1. See Figure 2-79. Position upper belt guard (1) and spacer (3).
2. See Figure 2-80. Install swingarm brace (13) with swing-arm brace mounting fasteners (12) loosely. Do not tighten.
3. See Figure 2-79. Tighten upper belt guard (2) fasteners to 12-36 in-lbs (1-4 Nm).
4. See Figure 2-80. Tighten swingarm brace fasteners (12) to 25-27 ft-lbs (34-37 Nm).
5. See Figure 2-78. Tighten rear axle (1) to 48-52 ft-lbs (65-70 Nm).
6. Tighten rear axle pinch fastener (2) to 40-45 ft-lbs (54-61 Nm).
7. Install left side passenger footpeg mount tightening fasteners to 15-18 ft-lbs (20-24 Nm). See 2.30 FOOTPEG, HEEL GUARD AND MOUNT.
8. Install right side passenger footpeg mount tightening fasteners to 15-18 ft-lbs (20-24 Nm). See 2.30 FOOTPEG, HEEL GUARD AND MOUNT.
9. Install right side rider footpeg mount tightening fasteners to 108-132 in-lbs (12-15 Nm). See 2.30 FOOTPEG, HEEL GUARD AND MOUNT.
10. Install heel guard. See 2.30 FOOTPEG, HEEL GUARD AND MOUNT.
11. Remove rear wheel support stand.

Final Swingarm Inspection

1. Check oil level after starting motorcycle and allowing it to reach operating temperature.
2. Check rear brake operation.
FRONT ISOLATOR

Removal

CAUTION

Avoid cross-threading front isolator bolt or insert. Keep weight of motorcycle off front isolator by alternately loosening front isolator bolt and raising scissor jack to support engine.

1. Place a scissor jack under jacking point for supporting engine only. For location of jacking point see Figure 2-99.
2. See Figure 2-82. Remove clutch cable p-clamp.
3. See Figure 2-83. Remove front isolator bolt (6).
4. Remove front isolator mount fasteners (5).
5. Remove front isolator bracket (4).
6. Remove upper snubber fastener (2) and remove upper snubber (1).

Installation

1. See Figure 2-83. Install upper snubber (1) tightening snubber fastener (2) to 12-36 in-lbs (1-4 Nm).
2. See Figure 2-84. Lubricate front isolator bolt with ANTI-SEIZE and loosely install.
3. See Figure 2-83. Use LOCTITE 272 on front isolator bracket (4) and install. Tightening fastener (5) to 49-51 ft-lbs (66-69 Nm).

CAUTION

Avoid cross-threading front isolator bolt or insert. Keep weight of motorcycle off front isolator by alternately tightening front isolator bolt and raising scissor jack to support engine.

4. Tighten front isolator bolt (6) to 49-51 ft-lbs (66-69 Nm).
5. See Figure 2-82. Install clutch cable p-clamp. Tighten fastener to 12-36 in-lbs (1-4 Nm).

REAR ISOLATOR

NOTE

It is necessary to remove engine to access rear isolator.

See 3.4 STRIPPING MOTORCYCLE FOR ENGINE SERVICE to access the rear isolator.
REMOVAL

1. Remove fuel from frame. See DRAINING FUEL TANK in 4.38 FUEL PUMP.
2. Rotate engine. See 3.3 ENGINE ROTATION FOR SERVICE.
3. Remove exhaust header. See 2.29 EXHAUST SYSTEM.
4. Remove tail frame. See 2.37 LEFT TAIL SECTION AND BATTERY PAN.
5. Remove rear shock. See 2.22 REAR SHOCK ABSORBER.
6. Remove upper and lower fork clamps. See 2.17 FORK CLAMPS, UPPER AND LOWER.
7. Remove main wire harness. See 7.24 MAIN WIRE HARNESS.
8. Remove rear isolator fastener. See 2.20 FRONT AND REAR ISOLATORS.
9. See Figure 2-85. Lift and remove frame from the motorcycle.

INSTALLATION

1. Place frame over the motorcycle.
2. Install rear isolator fastener. See 2.20 FRONT AND REAR ISOLATORS.
3. Install main wire harness. See 7.24 MAIN WIRE HARNESS.
4. Install upper and lower fork clamps. See 2.17 FORK CLAMPS, UPPER AND LOWER.
5. Install rear shock. See 2.22 REAR SHOCK ABSORBER.
6. Install tail frame. See 2.37 LEFT TAIL SECTION AND BATTERY PAN.
7. Install exhaust header. See 2.29 EXHAUST SYSTEM.
8. Rotate engine. See 3.3 ENGINE ROTATION FOR SERVICE.
GENERAL

The rear suspension is controlled by the shock absorber. The XB9S shock allows adjustment of rear compression and rebound damping and spring preload.

The most important rear shock adjustment is the preload setting. Before making any damping adjustments, set the proper preload. See 1.12 SUSPENSION DAMPING ADJUSTMENTS.

Figure 2-86. Rear Shock Absorber Assembly
REMOVAL

1. Remove seat. See 2.41 SEAT.

**WARNING**

Always disconnect the negative battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

2. Disconnect and remove battery. See 1.5 BATTERY MAINTENANCE.

3. Place a scissor jack under jacking point at the rear muffler and raise chassis until load has been removed from the lower shock bolt (7). See 2.29 EXHAUST SYSTEM for jacking point.
   a. Remove the nut (4) and washer (5) from the lower shock bolt and raise scissor jack until the lower bolt can be removed by hand.
   b. After removing both shock fasteners (7, 9) and reservoir clamp fastener (1), remove rear shock assembly and reservoir.

   **NOTE**
   Remove shock assembly through the top of the tail section (opening underneath rider seat).

INSTALLATION

1. See Figure 2-86. Install rear shock assembly in upper shock mount

2. Install fastener (9) and tighten to 49-51 ft-lbs (66-69 Nm).

3. Install lower shock mount with fasteners (4, 5, 7) and lower shock mount sleeve (6) and tighten to 15-17 ft-lbs (20.3-23 Nm).

4. Install rear shock reservoir through reservoir clamp and tighten clamp on reservoir to 96-120 in-lbs (11-14 Nm).

   **NOTE**
   Verify compression dial is facing up. See Figure 2-87.

   **WARNING**
   Always connect the positive battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

5. Install positive battery cable (red) to positive terminal of battery. Tighten to 72-96 in-lbs (8-11 Nm).

6. Connect negative battery cable. Tighten to 72-96 in-lbs (8-11 Nm).

   **WARNING**
   After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

7. Install seat. See 2.41 SEAT.
REMOVAL/DISASSEMBLY

1. See Figure 2-88. Loosen cable adjuster lock (thick disc) (3) on each cable.
2. Turn adjusters (3) in direction which will shorten cable housings to minimum length.
3. Remove fasteners (1) on right switch housing and separate housing from handlebar.
4. See Figure 2-89. Remove cables (2, 3) from notches in front housing (4).
5. Remove cables (2, 3) and ferrules (6) from cable wheel (7).
6. Remove airbox cover and baseplate. See 4.43 AIRBOX.
7. Disconnect cables from throttle body manifold to remove.
8. Cut cable straps and remove cables.

CLEANING AND INSPECTION

**WARNING**
Compressed air can pierce the skin and cause injury. Never use your hand to check for leaks or to determine air flow rates. Wear safety glasses to shield your eyes from flying dirt and debris. Failure to comply could result in death or serious injury.

Clean all parts except cables in a non-flammable cleaning solvent. Blow dry with compressed air. Replace cables if frayed, kinked or bent.

ASSEMBLY/INSTALLATION

1. Route cable as shown in D.1 HOSE AND WIRE ROUTING.
2. Add cable straps as shown in the throttle cable routing in D.1 HOSE AND WIRE ROUTING.
3. Install throttle grip and position ferrules (6) into cable wheel (7).
4. Insert idle control into front switch housing.
5. Slide switch housing over throttle.
6. Insert throttle cable into front switch housing.
7. See Figure 2-88. Attach rear switch housing and position housings on right handlebar by engaging locating pin on front housing with hole in handlebar. Attach housings with two fasteners, installing longer fastener on bottom. Tighten to 25-33 in-lbs (3-4 Nm).
8. Adjust cables. See 1.16 THROTTLE CABLE AND IDLE SPEED ADJUSTMENT.
9. Install airbox assembly. See 4.43 AIRBOX.
REMOVAL/DISASSEMBLY

NOTE
For clutch adjustment, see 1.9 CLUTCH.

1. See Figure 2-90. Remove p-clamp from front isolator.
2. See Figure 2-91. Slide clutch cable adjuster boot (8) up to access clutch adjuster (7).
3. Loosen clutch adjuster (7) to release tension from hand lever (4).
4. Remove clutch cable ferrule (9) from hand lever (4).
5. Remove hand lever pinch bolt (3).
6. Remove hand lever (4) from hand lever clamp (2).
7. Remove safety interlock switch (5).
   a. Remove hand lever clamp fastener (1) and spin clamp (2) to access safety interlock switch (5).
   b. Disconnect safety interlock switch connector (5) and remove switch fastener (6) and switch (5).

NOTE
The individual parts of the clutch switch are not serviceable. Replace switch upon failure.

8. Remove left handlebar grip.
9. Slide clutch lever bracket off of handlebar.

ASSEMBLY/INSTALLATION

1. See Figure 2-91. Slide hand lever clutch clamp (2) over left handlebar. Loosely tighten hand lever pinch fastener and nut (3).
2. Connect safety interlock connector and switch (5).
3. Install safety interlock switch (5) with fastener (6) tightening to 7-10 in-lbs (0.8-1.0 Nm).

NOTE
Apply small amount of LOCTITE ANTI-SEIZE LUBRICANT to bolt (3).

4. Install clutch hand lever (4) in hand lever clamp (2) and tighten hand lever pinch fastener (3) to 39-48 in-lbs (4-5 Nm).
5. Position hand lever (4) to rider preference and tighten hand lever clamp pivot fastener (1) to 36-60 in-lbs (4-7 Nm).
6. Connect clutch cable ferrule (9) to hand lever clamp (2).
7. Install cable strap holding safety interlock switch and left switch housing on left upper fork. Do not over tighten cable strap.
8. Adjust clutch cable. See 1.9 CLUTCH.
REMOVAL

1. Remove seat. See 2.41 SEAT.

**WARNING**

To protect against accidental start-up of vehicle and possible personal injury, disconnect the negative battery cable before proceeding. Inadequate safety precautions could cause a battery explosion, which could result in death or serious injury.

2. Disconnect battery by unthreading fastener removing negative cable (black) from battery first. See 1.5 BATTERY MAINTENANCE.

3. Remove windscreen. See 2.40 FRONT WINDSCREEN.

4. See Figure 2-92. Disconnect horn connectors [122] (2) and remove horn fastener (4) and horn (1).

**NOTE**

Horn bracket (3) should remain attached to headlight support bracket.

5. See Figure 2-92. Disconnect headlight connector [38] (5).

6. Remove female connector from headlight support bracket by sliding connector upward and off of attachment clip.

7. Remove headlight assembly.
   a. Remove both upper headlight assembly fasteners (6).
   b. Remove lower fastener (not shown).
   c. Remove headlight assembly (7) from headlight support bracket (9).

8. Remove remaining two fasteners (8) securing headlight support bracket to left and right front modules (10).

9. Remove headlight support bracket (9) by sliding the left side of the bracket (on right side of vehicle) up, back and then out.

**NOTE**

The horn bracket (3) should be attached to the headlight support bracket and should be removed as needed.
HOME

DISASSEMBLY
1. See Figure 2-93. Remove rubber boots (1) from rear of headlight housing.
2. Disconnect wiring harness (5) from headlight bulbs (3) and remove along with position bulb socket (6).
3. Remove bulb holders (2).
4. Remove headlight bulbs (3) from back of headlight housing (4).

ASSEMBLY
1. See Figure 2-93. Align and install headlight bulbs (3) into back of headlight housing (4).

NOTE
The tab on the base of the headlight bulb should rest between the two tabs located at the top of the hole on the back of the headlight assembly.
2. Install bulb holders (2).
3. Connect wiring harness (5) to headlight bulbs (3) and install rubber boots (1) and install position bulb socket (6) between the headlights.

Figure 2-93. Headlight Assembly
1. See Figure 2-94. Install headlight support bracket (9).

2. Install fasteners (8) securing headlight support bracket to left and right front modules (10) and tighten to 48-72 in-lbs (5.4-8.1 Nm).

3. Install headlight assembly.
   a. Install headlight assembly (7) into headlight support bracket (9).
   b. Install both upper headlight fasteners (6) but do not tighten.
   c. Install lower fastener (not shown), do not tighten.

4. Attach headlight connector to headlight support bracket.

5. Connect headlight connector [38] (5).

6. Install horn (1) and tighten fastener (4) to 72-96 in lbs (8.1-10.8 Nm).

7. Connect horn connectors [122] (2).

8. Adjust headlights. See 1.18 HEADLIGHTS.

9. Install windscreen. See 2.40 FRONT WINDSCREEN.

**WARNING**
Always connect the positive battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

10. Install battery by threading positive cable (red) into threaded hole first tightening to 72-96 in-lbs (8-11 Nm). See 1.5 BATTERY MAINTENANCE.

**WARNING**
After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

11. Install seat. See 2.41 SEAT.

**Figure 2-94. Headlight Assembly and Support Bracket**

1. Horn
2. Horn connectors [122]
3. Horn bracket
4. Horn fastener
5. Headlight connector [38]
6. Screws (2), upper headlight mounting
7. Headlight assembly
8. Screws (2), headlight support bracket
9. Headlight support bracket
10. Left and right front modules
FRONT MODULES

REMOVAL

1. Remove seat. See 2.41 SEAT.

**WARNING**
To protect against accidental start-up of vehicle and possible personal injury, disconnect the negative battery cable before proceeding. Inadequate safety precautions could cause a battery explosion, which could result in death or serious injury.

2. Disconnect battery by unthreading fastener removing negative cable (black) from battery first. See 1.5 BATTERY MAINTENANCE.

3. Remove windscreen. See 2.40 FRONT WINDSCREEN.

4. Remove headlight assembly and support bracket. See 2.25 HEADLIGHT ASSEMBLY AND SUPPORT BRACKET.

5. Disconnect and remove instrument module. See 7.18 INSTRUMENT MODULE.

6. Remove ignition switch. See 7.3 IGNITION/HEADLIGHT KEY SWITCH.

**NOTE**
See Figure 2-95. Once the ignition switch has been removed there will be two remaining fasteners.

7. See Figure 2-95. Remove fastener attaching p-clamp to rear side of right front module.

**NOTE**
See Figure 2-96. Once the clamp load has been released on the final fastener securing the right front module to the upper triple clamp, the left front module can be removed.

8. See Figure 2-95. Loosen but do not remove final fastener securing the right front module to upper triple clamp.

9. See Figure 2-96. Remove the left front module.

10. See Figure 2-95. Remove the final fastener and the right front module.

INSTALLATION

1. See Figure 2-95. Install right front module leaving single fastener loose.

2. After installing the left front module and aligning with holes in upper triple clamp, tighten previously installed single fastener to 12-14 ft-lbs (16.3-19 Nm).

3. Attach front brake line p-clamp to rear of right front module and tighten fastener to 36-60 in-lbs (4.1-6.8 Nm).

4. Install ignition switch. See 7.3 IGNITION/HEADLIGHT KEY SWITCH.

5. Install and connect instrument module. See 7.18 INSTRUMENT MODULE.

6. Install headlight assembly and support bracket. 2.25 HEADLIGHT ASSEMBLY AND SUPPORT BRACKET.

7. Install windscreen. See 2.40 FRONT WINDSCREEN.

**WARNING**
Always connect the positive battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

8. Install battery by threading positive cable (red) into threaded hole first tightening to 72-96 in-lbs (8-11 Nm). See 1.5 BATTERY MAINTENANCE.

**WARNING**
After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

9. Install seat. See 2.41 SEAT.
Figure 2-95. Right Front Module Fastener and Brake Line P-Clamp Fastener

1. Left and right front module
2. Right front module overlaps left front module
3. Right front module
4. Left front module

Figure 2-96. Fairing Support Bracket Assembly
HANDLEBARS

REMOVAL

1. Remove seat. See 2.41 SEAT.

2. Disconnect battery negative cable.

3. Remove left handlebar switch housing. See 7.16 HANDLEBAR SWITCHES. Cut left handlebar grip and remove.

4. Detach clutch hand control from handlebars. See 2.24 CLUTCH HAND LEVER.

5. Remove front brake master cylinder. See 2.10 FRONT BRAKE MASTER CYLINDER AND HAND LEVER.

6. Loosen screws on right handlebar switch housing, but do not detach throttle grip assembly from handlebar. See 2.23 THROTTLE CONTROL.

7. See Figure 2-97. Remove the four screws holding upper handlebar clamp.

   NOTE

   Right hand control assembly may now be removed from detached handlebar.

8. Remove handlebars without stretching throttle cables.

9. See Figure 2-97. Remove endcaps.

INSTALLATION

1. Slide handlebars into throttle grip assembly. Fasten right handlebar switch housing to handlebar. See 2.23 THROTTLE CONTROL.

2. See Figure 2-97. Attach handlebars.
   a. Position handlebar on lower clamp.
   b. Place the upper handlebar clamp in position and thread the four screws in place after applying Loctite 272 (Red).
   c. Tighten both front screws to 10-12 ft-lbs (14-16 Nm).
   d. Then tighten both rear screws (2) 10-12 ft-lbs (14-16 Nm).

3. Install clutch hand control. See 2.24 CLUTCH HAND LEVER.

4. Install left switch housing. See 7.16 HANDLEBAR SWITCHES.

5. Check control wire routings. See D.1 HOSE AND WIRE ROUTING.
   a. Route right hand control wires between the lower clamp and fork tube and on the outside of the clutch cable.
   b. Route left hand control wires between the lower clamp and fork tube.

6. Install a new left hand grip.

7. Install front brake master cylinder. See 2.10 FRONT BRAKE MASTER CYLINDER AND HAND LEVER.

8. Check steering motion range to both fork stops.

   WARNING

   Always connect the positive battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

9. Install battery by threading positive cable (red) into threaded hole first tightening to 72-96 in-lbs (8-11 Nm). See 1.5 BATTERY MAINTENANCE.

   WARNING

   After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

10. Install seat. See 2.41 SEAT.
1. Endcap (2)
2. Handlebar
3. Handlebar clamp
4. Clamp fasteners (4)
5. Left hand grip

Figure 2-97. Handlebar Assembly
MIRRORS

REMOVAL
1. See Figure 2-98. Loosen adjuster nut (2) and remove mirror (1) from mount (3).
2. Loosen mount (3) and remove from bracket (4).

INSTALLATION
1. Install mount (3) onto bracket (4) and tighten to 20-22 ft-lbs (27.1-29.8 Nm).

NOTE
Before tightening adjuster nut, position mirrors for rider.

2. Install mirror (1) and tighten adjuster to 115-130 in-lbs (13-14.7 Nm).
REMOVAL/DISASSEMBLY

Muffler
1. Remove chin fairing. See 2.34 CHIN FAIRING.
2. Remove front sprocket cover. See 2.31 SPROCKET COVER.
3. Remove idler pulley. See DRIVE BELT REMOVAL in 1.10 DRIVE BELT.
4. See Figure 2-99. Loosen front muffler mount fastener (7) but do not remove.
5. Remove front and rear muffler straps.
   Front: Remove front muffler strap fastener (5). Front strap will not be removed.
   Rear: Alternately loosen rear strap fasteners (1) and remove straps (2).
6. See Figure 2-100. Loosen Torca clamp (1) and remove muffler.

NOTE
The muffler may be removed for replacement without removing the exhaust header.

Front Muffler Mount
1. Remove muffler. See Muffler in this section.

Rear Muffler Bracket
1. Remove muffler. See Muffler in this section.
2. Drain oil. See Draining Oil in 1.6 ENGINE LUBRICATION SYSTEM.
3. Remove oil lines from swingarm. See 3.9 OIL HOSE ROUTING AND OIL RESERVOIR.
4. See Figure 2-99. Remove rear muffler bracket fasteners (10).
5. Slide oil lines from rear muffler bracket and remove rear muffler bracket (9).

Exhaust Header
1. Rotate engine down. See 3.3 ENGINE ROTATION FOR SERVICE.
2. Remove oxygen sensor. See 4.32 OXYGEN SENSOR.
3. See Figure 2-100. Remove exhaust header (2) by removing mounting fasteners (3).
4. Remove exhaust ring (4), retaining ring (5) and port gasket (6).
Exhaust Header

1. See Figure 2-100. Install exhaust ring (4), retaining ring (5) and new port gasket (6).

2. Install exhaust header (2). Tighten mounting fasteners (3) to 72-96 in-lbs (8-11 Nm).

   **NOTE**
   
   Tighten header nuts gradually, alternating between studs to insure that exhaust rings are flush with engine.

3. Install oxygen sensor. See 4.32 OXYGEN SENSOR.

4. Rotate engine up. See 3.3 ENGINE ROTATION FOR SERVICE.

Rear Muffler Mounting Block

1. See Figure 2-99. Slide rear muffler bracket (9) over oil lines.

2. Install rear muffler mounting bracket fasteners (10) and tighten to 32-36 ft-lbs (43-49 Nm).

3. Install oil lines to swingarm. See 3.9 OIL HOSE ROUTING AND OIL RESERVOIR.

4. Fill swingarm/oil tank with 2.5 quarts (3.3 liters) oil. See Draining Oil in 1.6 ENGINE LUBRICATION SYSTEM.

5. Install muffler. See Muffler in this section.

Front Muffler Mount

1. See Figure 2-99. Install front muffler mount bushings (8).

2. Install strap on front muffler mount (6).

3. Install front muffler mount fastener (7) loosely. **Do not tighten**.

4. Install muffler. See Muffler in this section.

Muffler and Straps

   **NOTE**
   
   Torca muffler clamps have eliminated the need for silicone or graphite tape during assembly. To ensure sealing integrity of muffler clamps and prevent the possibility of leakage, Buell recommends that muffler clamp assemblies be discarded and replaced each time they are removed.

1. Install muffler and new Torca clamp onto header.

   **NOTE**
   
   If necessary, use a fiber hammer to fit muffler on header.

2. See Figure 2-99. Loosely install front and rear muffler straps (2, 4).

   **WARNING**
   
   Muffler straps must be tightened in steps to keep from over tightening or muffler will be crushed.

   **WARNING**
   
   Always ensure that straps do not contact the chin fairing or the idler pulley assembly.

3. Tighten front strap fastener and alternately tighten rear muffler strap fasteners evenly till fasteners are tightened to:

   - **Front**: 108-120 in-lbs (12-14 Nm).
   - **Rear**: 48-60 in-lbs (5-7 Nm).

4. See Figure 2-99. Tighten front muffler mount fastener (7) to 22-25 ft-lbs (30-34 Nm).

5. See Figure 2-100. Tighten the Torca clamp (1) to 40-45 ft-lbs (54-61 Nm).

6. Install idler pulley. See DRIVE BELT REMOVAL in 1.10 DRIVE BELT.

7. Install front sprocket cover. See 2.31 SPROCKET COVER.

8. Install chin fairing. See 2.34 CHIN FAIRING.
RIDER

Remove Wear Peg
1. See Figure 2-101. Remove wear peg from end of footpeg assembly.

Remove Footpeg
1. See Figure 2-101. Remove clip (5).
2. Remove footpeg pin (9).
3. Remove footpeg (8).

Remove Heel Guard
1. See Figure 2-101. Remove heel guard fasteners (4).
2. Remove heel guard (3).

Remove Mount
1. See Figure 2-101. Remove footpeg mount fasteners (2).
2. Remove footpeg mount (1).

Install Mount
1. See Figure 2-101. Position footpeg mount (1).
2. Install footpeg mount with fasteners (2). Tighten to 108-132 in-lbs (12-15 Nm).

Install Heel Guard
1. See Figure 2-101. Position heel guard (3) onto footpeg mount (1).
2. Install heel guard (3) with fasteners (4). Tighten to 72-96 in-lbs (8-11 Nm).

Install Footpeg
1. See Figure 2-101. Install clip (5).
2. Position footpeg (8) on to footpeg mount (1).
3. Install footpeg pin (9).

Install Wear Peg
1. See Figure 2-101. Apply Loctite 272 (Red) and tighten to 36-48 in-lbs (4.1-5.4 Nm).

---

Figure 2-101. Rider Footpeg, Mount and Heel Guard Assembly

1. Footpeg mount
2. Footpeg mount fasteners
3. Heel guard
4. Heel guard fasteners
5. Clip, footpeg

6. Spring
7. Wear peg
8. Footpeg
9. Pin
Remove Footpeg

1. See Figure 2-102. Remove clip (7).
2. Remove footpeg pin (9).
3. Remove footpeg (8), detent plate (6), ball (5) and spring (4).

Remove Heel Guard

1. See Figure 2-102. Remove heel guard fasteners (1).
2. Remove heel guard (2).

Remove Mount

NOTE
The portion of the right and left tail sections where the passenger footpeg supports attach is threaded at both locations. A jam nut is utilized on one of the fasteners on each side in order to help secure battery pan.

1. See Figure 2-102. Remove footpeg mount fasteners (10).
2. Remove footpeg mount (3).

Install Mount

1. See Figure 2-102. Position footpeg mount (3) onto tail section.
2. Apply LOCTITE 272 (Red) to footpeg mount fasteners (10), install and tighten to 25-28 ft-lbs (34-38 Nm).
3. Install jam nut (11) and tighten to 48-72 in-lbs (5.4-8.1 Nm).

Install Heel Guard

1. See Figure 2-102. Position heel guard (2) onto footpeg mounts (3).
2. Install heel guard fasteners tightening to 48-72 in-lbs (5-8 Nm).

Install Footpeg

1. See Figure 2-102. Position footpeg (8), detent plate (6), ball (5), and spring (4) on to footpeg mount (3).
2. Install footpeg pin (9).
3. Install clip (7).
4. Check that footpeg clicks in the up and down position.

Figure 2-102. Passenger Footpeg, Mount and Heel Guard Assembly
REMOVAL

1. See Figure 2-103. Remove back right chin fairing fasteners.

   NOTE
   Must remove two chin fairing fasteners for sprocket cover access.

2. See Figure 2-104. Remove sprocket cover fasteners and washers (1).

INSTALLATION

1. See Figure 2-104. Position sprocket cover (2) over front belt guard (3) and front sprocket.

2. Install sprocket cover (2) using LOCTITE 222 on rear sprocket cover fastener (1) and tighten all fasteners and washers (1) to 12-36 in-lbs (1-4 Nm).

3. Install chin fairing. See 2.34 CHIN FAIRING.
FRONT FENDER

Removal
1. See Figure 2-105. Remove fasteners and washers (2) securing the front fender (1) to front forks.
2. Carefully remove front fender (1).

Installation
1. See Figure 2-105. Align front fender (1) to fender mounts on front forks.
2. Install front fender (1) with fasteners and washers (2) and tighten to 12-36 in-lbs (1-4 Nm).

REAR FENDER

Removal
1. Remove rear wheel. See 2.6 REAR WHEEL.
2. See Figure 2-105. Remove fasteners and washers (4) securing the rear fender (3) to frame.
3. Remove rear fender (3).

Installation
1. See Figure 2-105. Align rear fender (3) to frame.
2. Install rear fender (3) with fasteners and washers (4). Tighten to 12-15 in-lbs (1.1-1.7 Nm).
REMOVAL

1. Place a scissor jack under jacking point and raise rear wheel off ground. For location of jacking point see Figure 2-99.
2. Remove right side rider footrest support bracket.
3. Remove right passenger footrest support bracket.
4. See Figure 2-106. Remove front sprocket cover (5) by remove fasteners (6).
   
   **NOTE**
   Must remove two chin fairing fasteners for access. Front belt guard will dangle but can not be removed at this time.
5. Loosen rear axle pinch fastener.
6. Loosen rear axle approximately 15 rotations to allow partial tension to be removed from rear drive system.
7. Remove idler pulley assembly by removing nuts and washers. See IDLER PULLEY REMOVAL in 6.5 DRIVE BELT SYSTEM.
8. Remove lower belt guard (3) by removing fasteners (7).
9. Remove upper belt guard (10) by removing fasteners (8, 9).
   
   **NOTE**
   The upper belt guard is attached to the swingarm Brace and can not be removed from vehicle at this time.
10. Remove swingarm brace by removing fasteners. See 2.19 SWINGARM AND BRACE.
   a. Remove spacer collar (2) between upper belt guard (10), inner belt guard (1) and swingarm brace.
   b. Allow inner belt guard (1) to drape.
   
   **NOTE**
   Inner belt guard does not have to be removed to remove belt or rear wheel.
11. Remove upper belt guard (10) by removing fasteners from swingarm brace.
12. Remove belt from sprocket.
   
   **NOTE**
   Inner belt guard does not have to be removed to remove belt or rear wheel.
13. Removing inner belt guard (1).
   a. Remove rear axle.
   b. Remove inner belt guard (1) from swingarm.
   
   **NOTE**
   The rear wheel does not have to be removed to remove inner belt guard.

INSTALLATION

1. See Figure 2-106. Installing inner belt guard (1).
   a. Slide inner guard between rear wheel and swingarm.
   b. Partially install rear axle.
2. Install front belt guard (4). Do not tighten.
3. Install belt.
4. Install upper belt guard (10) to swingarm brace tightening fasteners to 12-36 in-lbs (1-4 Nm).
5. Loosely install swingarm brace. See 2.19 SWINGARM AND BRACE.
   a. Position the inner belt guard (1) and upper belt guard (10) onto swingarm.
   b. Install spacer collar (2) between upper belt guard (10), inner belt guard (1) and swingarm brace.
6. Install upper belt guard (10) and tighten fasteners (8, 9) to 12-36 in-lbs (1-4 Nm).
7. Tighten swingarm brace fasteners to 25-27 ft-lbs (34-37 Nm).
8. Install lower belt guard (3) and tighten fasteners (7) to 12-36 in-lbs (1-4 Nm).
9. Install idler pulley assembly tightening washers, nuts and fasteners to 33-35 ft-lbs (45-47 Nm). See IDLER PULLEY INSTALLATION in 6.5 DRIVE BELT SYSTEM.
10. Tighten rear axle to 48-52 ft-lbs (65-70 Nm).
11. Tighten rear axle pinch fastener to 40-45 ft-lbs (54-61 Nm).
12. Rotate rear wheel to ensure the belt does not make visible or audible contact. It may be necessary to loosen belt guard(s) to adjust for proper clearance.
13. Install front sprocket cover (5) by tightening fasteners (6) to 12-36 in-lbs (1-4 Nm).
14. Install chin fairing fasteners and tighten to 36-60 in-lbs (4-7 Nm).
15. Install right side rider footrest mount and tighten fasteners to 108-132 in-lbs (12-15 Nm).
16. Install right passenger footrest mount, use LOCTITE 272 (Red) and tighten fasteners to 25-28 ft-lbs (34-38 Nm).
17. Remove scissor jack from motorcycle.

2003 Buell XB9S: Chassis  2-79

2. Spacer collar
3. Lower belt guard
4. Front belt guard
5. Sprocket cover
6. Sprocket cover fasteners
7. Lower belt guard fasteners
8. Upper belt guard fasteners, short
9. Upper belt guard fasteners, long
10. Upper belt guard

Figure 2-106. Belt Guard Assembly
REMOVAL
1. Secure back tire down.
2. Turn wheel full right or left for easier access to center fasteners.
3. See Figure 2-107. Remove center section fasteners and washers (2).
4. Remove left section fasteners and washers (4) and remove left section (3).
5. Remove sprocket cover. See 2.31 SPROCKET COVER.
6. Remove right section fasteners and washers (6) and remove right section (5).

INSTALLATION
1. See Figure 2-107. Position right section (5) and install with right section fasteners and washers (6).
2. Position left section (3) and install with left section fasteners and washers (4).
3. Turn wheel full right or left for easier access to center fasteners.
4. Position center section (1) and install with center section fasteners and washers (2). Use LOCTITE 272 on all fasteners tightening to 36-48 in-lbs (4-5 Nm).
5. Install sprocket cover. See 2.31 SPROCKET COVER.
REMOVAL

1. Remove seat. See 2.41 SEAT.
2. See Figure 2-108. Remove fasteners and nylon washers (2).
3. Remove intake cover assembly (1).

INSTALLATION

1. Position intake cover assembly over top of airbox cover.
2. See Figure 2-108. Secure intake cover assembly (1) with fasteners and nylon washers (2). Tighten to 12-36 in-lbs (1-4 Nm).

NOTE
Front screws go in at a slight angle.
3. Install seat. See 2.41 SEAT.

Figure 2-108. Intake Cover Assembly
AIR SCOOPS

RAM AIR SCOOP

Removal
1. See Figure 2-109. On left side of bike, locate ram air scoop (4).
2. Remove three ram air scoop fasteners (3).
3. Remove ram air scoop (4).

Installation
1. See Figure 2-109. Position ram air scoop (4).
2. Install ram air scoop (4) with three fasteners (3). Tighten to 12-36 in-lbs (1-4 Nm).

ENGINE SHROUD AIR SCOOP

Removal
1. See Figure 2-109. On right side of bike, locate engine shroud air scoop (6).
2. Remove three engine shroud air scoop fasteners (5).
3. Remove engine shroud air scoop (6).

Installation
1. See Figure 2-109. Position engine shroud air scoop (6).
2. Install engine shroud air scoop (6) with three fasteners (5). Tighten to 12-36 in-lbs (1-4 Nm).

OIL COOLER AIR SCOOP

Removal
1. See Figure 2-109. On left side of bike, locate oil cooler air scoop (2).
2. Remove two oil cooler air scoop fasteners (1).
3. Remove oil cooler air scoop (2).

Installation
1. See Figure 2-109. Position oil cooler air scoop (2).
2. Apply LOCTITE 272 (Red) to oil cooler air scoop fasteners (1) and tighten to 120-144 in-lbs (14-16 Nm).
Figure 2-109. RAM Air Scoop, Engine Shroud, Oil Cooler

1. Oil cooler air scoop fastener and washer
2. Oil cooler air scoop
3. Ram air scoop fastener and washer
4. Ram air scoop
5. Engine scoop fastener and washer (3)
6. Engine scoop
DISASSEMBLY

1. Remove seat. See 2.41 SEAT.

WARNING

Always disconnect the negative battery cable first. If the positive battery cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

2. See Figure 2-110. Unthread fastener and remove battery negative cable (black) from battery negative (-) terminal.
3. Pull back terminal cover boot on battery positive cable (red).
4. Unthread fastener and remove battery positive cable from battery positive (+) terminal.
5. Remove battery.
6. See Figure 2-110. Disconnect:
   ● Wire harness ground (2) [GRD 2].
   ● Rear brake light switch connector (5) [121].
   ● ECM connectors (7) [10 & 11].
   ● BAS (bank angle sensor) connector (9) [134].
   ● Right turn signal connector (11) [19].
   ● Left turn signal connector (10) [18].
   ● License plate lamp connector (12) [45].
   ● Tail light connectors (13) [93].
   ● Ground terminals on right side tail section (6) [GRD1] & [GRD 3].
7. Remove the rear shock absorber reservoir. See 2.22 REAR SHOCK ABSORBER.
8. Cut cable strap loosely attaching BAS wire harness to seat latch cable.
9. See Figure 2-110. Remove fuse block and relay center from support bracket.
10. Move rear main harness and shock absorber reservoir to right side of vehicle.
11. Remove left side passenger footrest support assembly. See 2.30 FOOTPEG, HEEL GUARD AND MOUNT.
12. See Figure 2-110. Remove the following fasteners:
   ● Left front trunk pan to left side tail section (14).
   ● Left rear tail section to center tail section (15).
   ● Left tail section to main frame/fuel tank assembly.
13. Remove left tail section from vehicle.

NOTE

In order to remove trunk pan it will be necessary to remove the following fasteners and components.

14. Remove two fasteners securing trunk pan to center tail section.
15. See Figure 2-110. Remove fastener securing right front trunk pan to right side tail section.
16. Remove right side passenger footrest support assembly. See 2.30 FOOTPEG, HEEL GUARD AND MOUNT.
17. Slide trunk pan with battery pan, seat latch, bank angle sensor, rear shock reservoir mounting bracket and ECM out left side of vehicle.
18. Remove remaining components on trunk pan as needed.

CLEANING

CAUTION

Do not use wheel care products or other compounds developed specifically for cleaning and polishing powdercoat. These cleaners could potentially damage the tail section finish.

The cast aluminum tail section has a powder coat. Because the surface is not bare polished aluminum, it must be cleaned using only mild soap and warm water. After washing, always dry the surface using a clean, soft cloth.
1. Main harness

2. Main harness ground wire [GRD 2]

3. Battery ground cable

4. Battery positive cable

5. Rear brake light switch connector [121]

8. Fuse block and relay center

9. BAS (bank angle sensor) connector [134]

10. Left turn signal connector [18]

11. Right turn signal connector [19]

12. License plate lamp connector [45]

13. Tail light connectors [93]

14. Left and right front trunk pan fasteners (2)

15. Left rear and right rear tail section fasteners (4)

Figure 2-110. Main Harness and Electrical Connectors Under Seat
NOTE

See Figure 2-111. There are two threaded plastic lugs (14) on the trunk pan that are used for manufacturing purposes only.

1. Install trunk pan assembly (11) from left side of vehicle.
2. Install fastener (8) securing right front trunk pan to right side tail section. Apply Loctite 272 to threads of left rear tail sections fasteners and tighten to 102-112 in-lbs (11.5-12.7 Nm).
3. Install right side passenger footrest support assembly. See 2.30 FOOTPEG, HEEL GUARD AND MOUNT.
4. Install two fasteners (12) securing trunk pan to center tail section and leave loose.
5. Install left tail section (5) onto vehicle.
   a. Install fastener (8) attaching left front trunk pan to left side tail section and tighten to 48-72 in-lbs (5.4-8.1 Nm).
   b. Install fasteners (4) attaching left rear tail section to center tail section and tighten to 102-112 in-lbs (11.5-12.7 Nm).
   c. Install fasteners (1) attaching left tail section to main frame/fuel tank assembly and tighten to 21-23 ft-lbs (28.5-31.2 Nm).
6. Tighten fasteners (12) securing trunk pan to center tail section to 48-72 in-lbs (5.4-8.1 Nm).
7. Install left side passenger footrest support assembly. See 2.30 FOOTPEG, HEEL GUARD AND MOUNT.
8. Move rear main harness and shock absorber reservoir back to left side of vehicle.

9. See Figure 2-110. Connect:
   - Wire harness ground (2) [GRD 2].
   - Rear brake light switch connector (5) [121].
   - BAS (bank angle sensor) connector (9) [134].
   - Right turn signal connector (11) [18].
   - Left turn signal connector (10) [19].
   - License plate lamp connector (12) [45]
   - Tail light connectors (13) [93].
   - Ground terminals on right side tail section (6) [GRD 1] & [GRD 3].
10. Attach cable strap loosely securing the BAS harness to the seat latch cable.
11. Install the rear shock absorber reservoir into bracket and tighten fastener.

WARNING

Always connect positive battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

12. Install battery by threading positive cable (red) into threaded hole first tightening to 72-96 in-lbs (8-11 Nm). See 1.5 BATTERY MAINTENANCE.

WARNING

After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

13. Install seat. See 2.41 SEAT.
1. Left and right tail section fastener to main frame/fuel tank assembly (4)
2. Right tail section
3. Center tail section
4. Center tail section fastener to rear tail section (4)
5. Left tail section
6. Ground terminal fastener (2)
7. Passenger footrest support fastener with jam nut (2)
8. Front trunk pan fastener to side tail section (2)
9. Passenger footrest support fastener (no jam nut-2)
10. Seat latch assembly
11. Trunk pan assembly
12. Rear trunk pan fastener to center tail section (2)
13. Rear shock reservoir bracket
14. Plastic lugs (for manufacturing purposes only)

Figure 2-111. Tail Frame and Trunk Pan Assembly
**DISASSEMBLY**

1. Remove seat. See 2.41 SEAT.

**WARNING**

Always disconnect the negative battery cable first. If the positive battery cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

2. See Figure 2-110. Unthread fastener and remove battery negative cable (black) from battery negative (-) terminal.

3. See Figure 2-110. Disconnect:
   - Right turn signal connector [18].
   - Left turn signal connector [19].
   - License plate lamp connector [45]
   - Tail light connectors [93].

4. See Figure 2-111. Remove two fasteners (12) securing trunk pan to center tail section.

5. Remove fasteners (4) securing left and right tail sections to center tail section.

6. Remove center tail section from vehicle.

7. To further disassemble center tail section see 7.12 TAIL LAMP, 7.13 LICENSE PLATE LAMP ASSEMBLY, 7.14 TURN SIGNALS.

**ASSEMBLY**

1. Install center tail section between left and right tail sections.

2. Install fasteners (4) securing left and right tail sections to center tail section but do not tighten.

3. Install two fasteners (12) securing trunk pan to center tail section but do not tighten.

4. Apply Loctite 272 to threads of left and right rear tail sections fasteners (4) and tighten to 102-112 in-lbs (11.5-12.7 Nm).

5. Tighten fasteners (12) securing trunk pan to center tail section to 48-72 in-lbs (5.4-8.1 Nm).

6. See Figure 2-110. Connect:
   - Right turn signal connector [18].
   - Left turn signal connector [19].
   - License plate lamp connector [45]
   - Tail light connectors [93].

**WARNING**

Always connect positive battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

7. Install battery by threading positive cable (red) into threaded hole first tightening to 72-96 in-lbs (8.1 Nm). See 1.5 BATTERY MAINTENANCE.

**WARNING**

After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

8. Install seat. See 2.41 SEAT.
DISASSEMBLY

1. Remove seat. See 2.41 SEAT.

WARNING

Always disconnect the negative battery cable first. If the positive battery cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

2. See Figure 2-112. Unthread fastener and remove battery negative cable (black) from battery negative (-) terminal.
3. Pull back terminal cover boot on battery positive cable (red).
4. Unthread fastener and remove battery positive cable from battery positive (+) terminal.
5. Remove battery.
6. See Figure 2-1. Disconnect:
   - Right side ground terminals (3) [GRD1] & [GRD 3]
   - Rear brake light switch connector (4) [121]
7. Remove right side passenger footrest assembly. See 2.30 FOOTPEG, HEEL GUARD AND MOUNT.
8. Remove master cylinder remote reservoir. See 2.13 REAR BRAKE MASTER CYLINDER.
9. See Figure 2-112. Remove right front trunk pan fastener (1).
10. Remove fasteners (15) securing center tail section to right tail section.
11. See Figure 2-111. Remove fasteners (1) securing right tail section to main frame/fuel tank assembly.
12. Remove right tail section.

ASSEMBLY

1. See Figure 2-112. Install right tail section (6) onto vehicle.
   a. Install fastener (1) attaching right front trunk pan to right side tail section and tighten to 48-72 in-lbs (5.4-8.1 Nm).
   b. Install fasteners (5) attaching left rear tail section to center tail section and tighten to 102-112 in-lbs (11.5-12.7 Nm).
   c. Install fasteners attaching left tail section to main frame/fuel tank assembly and tighten to 21-23 ft-lbs (28.5-31.2 Nm).
2. Install master cylinder remote reservoir. See 2.13 REAR BRAKE MASTER CYLINDER.
3. Install right side passenger footrest support assembly. See 2.30 FOOTPEG, HEEL GUARD AND MOUNT.
4. See Figure 2-1. Connect:
   - Right side ground terminals (3) [GRD1] & [GRD 3]
   - Rear brake light switch connector (4) [121]

WARNING

Always connect positive battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

5. Install battery by threading positive cable (red) into threaded hole first tightening to 72-96 in-lbs (8-11 Nm). See 1.5 BATTERY MAINTENANCE.

WARNING

After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

6. Install seat. See 2.41 SEAT.
1. Right front trunk pan fastener
2. Passenger footrest support fastener with jam nut
3. Ground terminals [GRD1] & [GRD 3]
4. Rear brake light switch connector [121]
5. Right tail section
6. Center tail section fastener to rear tail section

Figure 2-112. Right Side Frame Section
REMOVAL

NOTE
The windscreen fasteners (3) extend through the left and right front modules (2, 5) and thread into the headlight mounting bracket (1).

1. See Figure 2-113. Remove four windscreen fasteners (3).
2. Remove windscreen (4).

INSTALLATION

1. See Figure 2-113. Position windscreen (4) onto left and right front modules (2, 5).
2. Install four fasteners (3) and tighten 10-12 in-lbs (1.1-1.4 Nm).

Figure 2-113. Front Windscreen

1. Headlight mounting bracket
2. Left front module
3. Windscreen fastener (4)
4. Windscreen
5. Right front module
REMOVAL

The seat anchors in three places on the vehicle. The first is where the locating tab (4) on the seat inserts into the opening on the trunk pan (5). The second is the pair of seats hooks (3) that slide onto the shouldered fasteners (6) located in the left and right tail sections. The last is the rear seat tab (2) which fits into the slot (7) on the seat latch (8).

1. See Figure 2-114. Insert ignition key into seat lock located on left side of motorcycle below seat.
2. Turn key clockwise to disengage rear seat latch.
3. Lift and remove seat (1).

INSTALLATION

WARNING

After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

1. Install seat (1) by sliding locating tab (4) on front underside of seat into opening (5) on trunk pan.
2. Align rear tab (2) with latch slot (7) at rear of motorcycle.
3. Press down firmly on rear of seat to engage seat latch (8). Pull up on rear of seat to make sure latch is engaged.
4. Remove ignition key from seat lock.

Figure 2-114. Seat and Attachment
REMOVAL

1. Remove seat. See 2.41 SEAT.
2. Cut cable strap loosely securing BAS wiring harness to seat lock cable.
3. See Figure 2-115. Disconnect seat lock cable:
   a. Remove latch (9) from latch bracket (10) by removing two fasteners (6).
   b. Slide retainer (7) away from cable end (8).
   c. Remove cable end (8) and cable (5) from latch.
4. Remove seat lock:
   a. Remove seat lock retainer (3) from seat lock (1).
   b. Remove seat lock (1) from plate (2) and trunk pan (11).
   **NOTE**
   When removing seat lock (1), cable end (4) should release from seat lock.
5. Remove cable (5) from plate (2).

INSTALLATION

1. See Figure 2-115. Install cable (5) into plate (2).
2. Install the seat lock (1) into trunk pan (11) and plate (2).
   **NOTES**
   ● Once seat lock has been started through the hole in the trunk pan and plate, now is the time to connect the cable end to the seat lock.
   ● Seat lock plate must be aligned to tab on seat lock for proper installation.
3. Install seat lock retainer (3) by aligning retainer to retainer grooves on back side of seat lock (1).
4. Connect seat lock cable to latch:
   a. Install cable end (8) and cable (5) onto latch.
   b. Slide retainer (7) over pin on latch to lock cable end (8) into place.
   c. Install latch (9) to latch bracket (10) and tighten fasteners (6).
   d. Install cable strap to loosely secure cable to BAS wiring harness.
5. Open and close the seat lock with ignition key to verify that cable is working properly.

**WARNING**

After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

6. Install seat. See 2.41 SEAT.

SIDESTAND

Removal

1. Remove muffler. See Muffler and Straps in 2.29 EXHAUST SYSTEM.

2. See Figure 2-118. Remove sidestand switch (6). See SIDESTAND SWITCH in this section.

3. Remove fasteners (2) securing sidestand bracket (3) to frame.

4. Remove sidestand.

Installation

1. Install sidestand to frame tightening the sidestand bracket fasteners to 25-27 ft-lbs (34-37 Nm).

2. Install sidestand switch to sidestand assembly.

3. Install muffler. See Muffler and Straps in 2.29 EXHAUST SYSTEM.

4. Inspect sidestand. See INSPECTION in this section.

SIDESTAND SWITCH

Removal

1. See Figure 2-116. Cut cable strap securing harness.

2. Remove shrink tubing covering connector [60] and unplug.

3. See Figure 2-117. Remove sidestand switch (2).
   a. Retract sidestand leg (6).
   b. Remove switch fastener (1).
   c. Extend sidestand leg (6).

4. Lift sidestand switch (2) and slide to the right away from spring post (4) on sidestand bracket (5).

Installation

5. Install sidestand switch (2).
   a. Extend sidestand leg (6).
   b. Install sidestand switch (2) by aligning the lug on the bottom side of the switch with the corresponding hole in the sidestand leg (6).
   c. Install the switch fastener (1) tightening to 36-60 in-lbs (4-7 Nm).
SIDESTAND DISASSEMBLY

1. Remove two fasteners from the left side of chin fairing.

   **NOTE**

   Sidestand assembly does not have to be removed from motorcycle in order to remove sidestand leg.

2. See Figure 2-118. Remove sidestand switch (6). See 2.43 SIDESTAND ASSEMBLY/ SIDESTAND SWITCH.

3. Remove sidestand leg (1).
   a. Retract sidestand leg.
   b. Remove sidestand spring (8) and spring extension plate (4) using SNAP-ON SPRING TOOL (Part No. HE-52B).
   c. Remove sidestand pivot bolt (5).
   d. Extend sidestand leg and remove.

SIDESTAND ASSEMBLY

1. Install sidestand leg (1).
   a. See Figure 2-118. Lubricate sidestand pivot bolt (5) and mating portions on sidestand bracket (2) with WHEEL BEARING GREASE (Part No. 99855-89) as shown in Figure 2-119.
   b. See Figure 2-120. Apply LOCTITE 272 (Red) to threaded area (clevis) of sidestand leg.

   **NOTE**

   Applying LOCTITE to threaded area of clevis on sidestand leg, instead of threads on the pivot bolt, will eliminate build-up between clevis and sidestand bracket which can interfere with the applied lubricant.

   c. See Figure 2-118. Install sidestand (1) and sidestand pivot bolt (5) tightening to 18-20 ft-lbs (24-27 Nm).
   d. Retract sidestand leg.
   e. Install spring extension plate (4) and sidestand spring (8) using SNAP-ON SPRING TOOL (Part No. HE-52B).

   **NOTE**

   Extension plate should curve away from primary chain adjustment screw to allow for clearance around adjustment screw.

2. See Figure 2-118. Install sidestand switch (6). See 2.43 SIDESTAND ASSEMBLY/ SIDESTAND SWITCH.

3. Install two fasteners into the left side of chin fairing and tighten.

FUEL

Gasoline/alcohol Blends

The Buell XB9S motorcycle has been designed to obtain the best performance and efficiency using a good quality unleaded gasoline. Buell recommends using at least 91 pump octane (RON). Octane rating is usually found on the pump. Some fuel suppliers sell gasoline/alcohol blends as a fuel. The type and amount of alcohol added to the fuel is important.

- DO NOT USE GASOLINES CONTAINING METHANOL. Using gasoline/methanol blends will result in starting and driveability deterioration and damage to critical fuel system components.

- Gasolines containing ETHANOL: Gasoline/ethanol blends are mixture of 10% ethanol (Grain alcohol) and 90% unleaded gasoline. Gasoline/ethanol blends can be used in your motorcycle if the ethanol content does not exceed 10%.

- Gasolines containing ETHER: Gasoline/ether blends are a mixture of gasoline and as much as 15% ether. Gasoline/ether blends can be used in your motorcycle if the ether content does not exceed 17%.

- REFORMULATED OR OXYGENATED GASOLINES (RFG): “Reformulated gasoline” is a term used to describe gasoline blends that are specifically designed to burn cleaner than other types of gasoline, leaving fewer “tailpipe” emissions. They are also formulated to evaporate less when you are filling your tank. Reformulated gasolines use additives to “oxygenate” the gas. Your motorcycle will run normally using this type of gas. Buell recommends you use it when possible, as an aid to cleaner air in our environment.

Because of their generally higher volatility, these blends may adversely affect the starting, driveability and fuel efficiency of your motorcycle. If you experience these problems, Buell recommends that you operate your motorcycle on straight, unleaded gasoline.

LUBRICATION

The engine has a force-feed (pressure) type oiling system, incorporating oil feed and return pumps in one pump body, with one check valve on the oil feed side. The feed pump forces oil through the oil cooler to the engine, lubricating lower connecting rod bearings, rocker arm bushings, valve stems, valve springs, push rods and tappets. Cylinder wall, piston, piston pin, timing gears, bushings and main bearings are lubricated by oil spray thrown off connecting rods and crankshaft, and by oil draining from each rocker box through an internal drain passage in each cylinder and each tappet guide. Oil is transferred to the teeth of all the cam gears by way of the gear meshing action. The oil-scavenging section of the pump returns oil to the tank from the engine. See 3.8 LUBRICATION SYSTEM for more information.

ADJUSTMENT/TESTING

General

When an engine needs repair, it is not always possible to determine definitely beforehand whether repair is possible with only cylinder head, cylinder and piston disassembled or whether complete engine disassembly is required for crankcase repair.

Most commonly, only cylinder head and cylinder repair is needed (valves, rings, piston, etc.) and it is recommended procedure to service these units first, allowing engine crankcase to remain in frame.

See 3.4 STRIPPING MOTORCYCLE FOR ENGINE SERVICE to strip motorcycle for removal of cylinder head, cylinder, and piston.

After disassembling “upper end” only, it may be found that crankcase repair is necessary. In this situation, remove the engine crankcase from the chassis.

CAUTION

If engine is removed from chassis, do not lay engine on primary side. Placing engine on primary side will damage clutch cable end fitting. If fitting is damaged, clutch cable must be replaced.

See 1.21 TROUBLESHOOTING section. Symptoms indicating a need for engine repair are often misleading, but generally, if more than one symptom is present, possible causes can be narrowed down to make at least a partial diagnosis. An above-normal consumption of oil, for example, could be caused by several mechanical faults. However, when accompanied by blue-gray exhaust smoke and low engine compression, it indicates the piston rings need replacing. Low compression by itself, however, may indicate improperly seated valves, in addition to or in lieu of worn piston rings.

Most frequently, valves, rings, pins, bushings, and bearings need attention at about the same time. If the possible causes can be narrowed down through the process of elimination to indicate any one of the above components is worn, it is best to give attention to all of the cylinder head and cylinder parts.
COMPRESSION TEST PROCEDURE

Combustion chamber leakage can result in unsatisfactory engine performance. A compression test can help determine the source of cylinder leakage. Use CYLINDER COMPRESSION GAUGE (Part No. HD-33223-1).

A proper compression test should be performed with the engine at normal operating temperature when possible. Proceed as follows:

**CAUTION**

After completing the compression test(s), make sure that the throttle plate is in the closed position before starting engine. Engine will start at an extremely high RPM if throttle plate is left open.

1. Disconnect spark plug wire. Clean around plug base and remove plug.
2. Connect compression tester to cylinder.
3. With induction module throttle plate in wide open position, crank engine continuously through 5-7 full compression strokes.
4. Note gauge readings at the end of the first and last compression strokes. Record test results.
5. Compression is normal if final readings are 120 psi (827 kPa) or more.
6. Inject approximately 1/2 oz. (15 ml) of SAE 30 oil into cylinder and repeat the compression test. Readings that are considerably higher during the second test indicate worn piston rings.

### Cylinder Leakage Test

The cylinder leakage test pinpoints engine problems including leaking valves, worn, broken or stuck piston rings and blown head gaskets. The cylinder leakage tester applies compressed air to the cylinder at a controlled pressure and volume, and measures the percent of leakage from the cylinder.

Use a CYLINDER LEAKDOWN TESTER (Part No. HD-35667A) and follow the specific instructions supplied with the tester.

The following are some general instructions that apply to Buell motorcycle engines:

<table>
<thead>
<tr>
<th>DIAGNOSIS</th>
<th>TEST RESULTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ring trouble</td>
<td>Compression low on first stroke; tends to build up on the following strokes but does not reach normal; improves considerably when oil is added to cylinder.</td>
</tr>
<tr>
<td>Valve trouble</td>
<td>Compression low on first stroke; does not build up much on following strokes; does not improve considerably with the addition of oil.</td>
</tr>
<tr>
<td>Head gasket leak</td>
<td>Same reaction as valve trouble.</td>
</tr>
</tbody>
</table>

### Table 3-17. Compression Test Results

**Diagnosing Smoking Engine or High Oil Consumption**

Perform COMPRESSION TEST PROCEDURE or Cylinder Leakage Test as described previously. If further testing is needed, remove suspect head(s) and inspect the following:

- Valve guide seals.
- Valve guide-to-valve stem clearance.
- Gasket surface of both head and cylinder.

### Table 3-18. Air Leakage Test

<table>
<thead>
<tr>
<th>AIR LEAK LOCATION</th>
<th>POSSIBLE CAUSES</th>
</tr>
</thead>
<tbody>
<tr>
<td>Induction Module intake</td>
<td>Intake valve leaking.</td>
</tr>
<tr>
<td>Exhaust pipe</td>
<td>Exhaust valve leaking.</td>
</tr>
<tr>
<td>Timing inspection hole</td>
<td>Piston rings leaking. Worn or broken piston. Worn cylinder.</td>
</tr>
<tr>
<td>Head gasket</td>
<td>Leaking gasket.</td>
</tr>
</tbody>
</table>

If air is escaping through valves, check push rod length.

9. Repeat procedure on rear cylinder.

**CAUTION**

After completing the compression test(s), make sure that the throttle plate is in the closed position before starting engine. Engine will start at an extremely high RPM if throttle plate is left open.

### Table 3-18. Air Leakage Test

**NOTE**

If air is escaping through valves, check push rod length.
The following process allows you to rotate engine down, pivoting on rear isolator mount, in order to service components in the top end. The engine does not need to be removed from chassis in order to perform top end repairs.

DISASSEMBLY

NOTE
Vehicle should be placed onto the lift with rear tire placed in the wheel vise in order to successfully perform this procedure.

1. Disconnect fuel pump and run vehicle until it is out of fuel.

NOTES
- This step is always performed in order to purge fuel lines.
- The connection for fuel pump is just above the pump located at the rear of the fuel tank on the left side of the vehicle.

WARNING
To protect against shock and accidental start-up of vehicle, disconnect the negative battery cable before proceeding. Inadequate safety precautions could result in death or serious injury.

2. Remove seat and disconnect battery.
3. Remove intake cover and airbox assembly.
4. Remove throttle body velocity stack.

NOTE
Cover velocity stack to prevent objects from falling into the induction module.

5. See Figure 3-1. Disconnect fuel line.
6. Disconnect the throttle position sensor (2) [88].
7. Disconnect the fuel injector leads (3) [84 & 85].
8. See Figure 3-2. Disconnect the ignition coil (2) [83] and remove.

9. See Figure 3-2. Disconnect the following sensors:
   a. Temperature sensor (3) [90].
   b. Oxygen sensor (4) [137].
10. Disconnect and remove air scoops, right and left sides.
11. Remove complete chin fairing.
12. Remove transmission sprocket side cover.
13. Remove rear belt and idler pulley. See 1.10 DRIVE BELT and 2.13 REAR BRAKE MASTER CYLINDER.

14. See Figure 3-3. Remove muffler:
   a. Remove front muffler strap (8).
   b. Remove rear muffler straps (13).
   c. Loosen Torca clamp (1) and remove muffler (14).
   d. Loosen front muffler mount (2).

Figure 3-3. Muffler and Mounting System
15. See Figure 3-4. Disconnect oil lines at oil cooler only.
16. Remove left side rider footrest and support plate.
17. See Figure 3-5. Disconnect clutch cable.
   a. Remove p-clamp (1) from front isolator.
   b. Slide clutch cable adjuster boot (2) up to access clutch adjuster.
   c. Loosen clutch adjuster to release tension from hand lever.
   d. Remove clutch cable ferrule from hand lever.

Figure 3-4. Oil Line Connections at Oil Cooler

1. Feed oil line from oil pump to oil cooler
2. Return oil line for oil cooler to crankcase

22. Fasteners for rear tie bar assembly (2)

Figure 3-6. Engine Mounting System
18. Support engine with wide scissors jack.
19. See Figure 3-6. Remove front “V” bracket with oil cooler from main frame:
   a. Remove cable strap securing the remote idle adjustment cable.
   b. Remove the three cable straps holding regulator wiring harness in order to extend the harness to remove “V” bracket.
   c. Unplug regulator harness, (2 plugs).
   d. Remove front tie bar from “V” bracket only.
   e. Unbolt “V” bracket from main frame and remove from left side.
20. Remove center tie-bar from engine.
21. See Figure 3-7. Remove rear tie bar from frame only.
22. Loosen rear isolator bolt. DO NOT REMOVE.
23. See Figure 3-8. Remove front isolator bolt (1).
24. Remove front isolator mount (2) from engine.
25. Rotate engine down.
REASSEMBLY

NOTE
● If exhaust header was removed during service it must be torqued with the engine rotated in the down position. It is not possible to reach fasteners on the rear exhaust at the head with engine rotated in the up position.
● Tighten header nuts gradually, alternating between studs to insure that exhaust rings are flush with engine. Tighten fasteners to 72-96 in-lbs (8.1-10.8 Nm).

1. When repairs have been completed, rotate engine back up into frame.

NOTE
When installing and tightening front isolator bolt it is important to keep load off of isolator bolt for installation purposes. Alternate between tightening front isolator bolt and raising engine with scissors jack.

1. Front isolator bolt
2. Front isolator mount
3. Front isolator mount fasteners (2)
4. Front tie bar

Figure 3-9. Lubrication Points on Front Isolator Bolt

NOTE
See Figure 3-9. Always coat shaft and threads of front isolator bolt with anti-seize before installing.

Figure 3-10. Front Isolator and Tie Bar Assemblies

2. See Figure 3-10. Insert front isolator bolt (1) through front isolator (2) and loosely thread into frame. Do not tighten at this point.

3. See Figure 3-10. Install isolator mounting fasteners (3) and tighten to 49-51 ft-lbs (66.4-69.1 Nm).

4. Tighten front isolator bolt to 49-51 ft-lbs (66.4-69.1 Nm).

5. See Figure 3-6. Torque rear isolator bolt to 49-51 ft-lbs (66.4-69.1 Nm).

6. See Figure 3-6. Install rear tie bar to frame and tighten to 25-27 ft-lbs (33.9-36.6 Nm).

7. See Figure 3-6. Install center tie bar to engine and tighten to 25-27 ft-lbs (33.9-36.6 Nm).

8. See Figure 3-6. Install front “V” bracket with oil cooler to main frame.
   a. Install “V” bracket to main frame from the left side of the vehicle and tighten to 120-144 in-lbs (13.6-16.3 Nm).
   b. Figure 3-10. Install front tie-bar to “V” bracket and tighten to 25-27 ft-lbs (33.9-36.6 Nm).
   c. Attach regulator wiring harness to bracket nylon cable straps.

9. Remove scissors jack.
10. See Figure 3-11. Pull clutch cable back up into the proper position.
   a. Connect clutch cable to handlebars and adjust to specifications. See 3.1 SPECIFICATIONS.
   b. Install retaining clamp.

   NOTE
   When torquing the feed oil line from the pump to the oil cooler it is necessary to torque the fitting at the oil pump first.

11. See Figure 3-12. Install oil cooler oil feed line first and tighten to 15-17 ft-lbs (20.3-23 Nm).

   NOTE
   When installing the oil cooler return oil line it is necessary to install the end at the crankcase first.

12. See Figure 3-12. Install the oil cooler return oil line and tighten to 15-17 ft-lbs (20.3-23 Nm).

1. Verify that the clutch cable and feed line have a clearance of 1/8-1/4 in. (3.175-6.35 mm) between them.
2. Verify that oil lines have a minimum clearance of 1/8 in. (3.175 mm) between them.
CAUTION

It is important that the front muffler mount is tightened last in order to ensure proper alignment of the exhaust system.

CAUTION

When rear muffler straps have been installed, it is important that strap fasteners do not contact idler pulley bracket.

13. See Figure 3-13. Install muffler with new Torca clamp but do not tighten:
   a. Install rear muffler straps and alternately tighten rear strap fasteners (6) to 48-60 in-lbs (5.4-6.8 Nm).
   b. Install front muffler strap fastener (3) and tighten to 108-120 in-lbs (12.2-13.6 Nm).
   c. Tighten Torca clamp to 40-45 ft-lbs (54.2-61 Nm).

14. Tighten front muffler mount to 22-25 ft-lbs (29.8-33.9 Nm).
15. See Figure 3-14. Connect throttle cables from induction module/throttle body.

16. Connect the following sensors:
   a. Temperature sensor (3) [90].
   b. Oxygen sensor (4) [137].

17. See Figure 3-14. Install the ignition coil and connect (2) [83] and tighten fasteners to 120-144 in-lbs (13.6-16.3 Nm).
Remove shop towel from entrance of throttle body to ensure proper operation of induction module.

18. See Figure 3-15. Connect throttle position sensor (2) [88].

19. Connect fuel injector leads (3) [84 & 85].

20. Connect fuel line.

21. Install throttle body velocity stack (tighten).

22. Install airbox assembly and intake cover and tighten fasteners to 84-120 in-lbs (9.5-13.6 Nm).

23. Install rear belt and idler pulley. See 1.10 DRIVE BELT and 2.13 REAR BRAKE MASTER CYLINDER.

24. Install left side rider footrest and support plate and tighten fasteners to 120-144 in-lbs (13.56-16.27 Nm).

25. Install sprocket cover and tighten fasteners and washers to 12-36 in-lbs (1-4 Nm).

26. Install chin fairing. See 2.34 CHIN FAIRING.

27. Install air scoops, right and left sides. See 2.36 AIR SCOOPS.

28. Connect fuel pump. **NOTE**

   The connection for fuel pump is just above the pump located at the rear of the fuel tank on the left side of the vehicle.

   **WARNING**

   Always connect positive battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

29. Connect negative ground cable to battery and install seat (tighten).

   **WARNING**

   Pull up on seat to verify that it is properly secured, front and rear. A loose seat may shift during vehicle operation and startle the rider, possibly causing loss of vehicle control resulting in death or serious injury.
DISASSEMBLY

NOTE
Vehicle should be placed onto the lift with rear tire in the wheel vise in order to successfully perform this procedure.

1. Disconnect fuel pump and run vehicle until it is out of fuel. See 4.40 FUEL PUMP.

NOTES
- This step is always performed in order to purge fuel lines.
- The connection for fuel pump is just above the pump located at the rear of the fuel tank on the left side of the vehicle.

2. Drain oil tank.

WARNING
To protect against shock and accidental start-up of vehicle, disconnect the negative battery cable before proceeding. Inadequate safety precautions could result in death or serious injury.

3. Remove seat and disconnect battery.
4. Remove intake cover and airbox assembly.
5. Remove throttle body velocity stack.

NOTE
Install shop towel in entrance to throttle body to prevent objects from falling into the induction module.

6. See Figure 3-16. Disconnect fuel line.
7. Disconnect throttle position sensor (2) [88].
8. Disconnect fuel injector leads (3) [84 & 85].

Figure 3-16. Fuel Line and DDFI Electrical Connections

1. Fuel line connection
2. Connection for throttle position sensor [88]
3. Connections for fuel injectors [84 & 85]
9. See Figure 3-17. Disconnect the ignition coil connector (2) and remove.

10. Disconnect the following sensors:
   c. Temperature sensor (3) [90].
   d. Oxygen sensor (4) [137].

11. Disconnect throttle cables from induction module/throttle body.
12. Disconnect and remove air scoops, right and left sides.
13. Remove complete chin fairing, (7) bolts.
14. Remove transmission sprocket side cover.
15. Remove rear belt and idler pulley. See 1.10 DRIVE BELT and 2.13 REAR BRAKE MASTER CYLINDER.

16. See Figure 3-18. Remove muffler:
   a. Remove front muffler strap fastener (7). Front strap will not be removed.
   b. Alternately loosen rear strap fasteners (12) and remove rear muffler straps.
   c. Loosen Torca clamp and remove muffler.
   d. Loosen front muffler mount.

Figure 3-18. Muffler and Mounting System

1. Clamp, Torca
2. Muffler mount, front
3. Screw, front muffler mount (1)
4. Bushings, front muffler mount (2)
5. Flat washer, front muffler mount (1)
6. Nut, front muffler mount (1)
7. Front muffler strap fastener
8. Muffler strap, front
9. Muffler bracket, rear
10. Screw, rear muffler bracket (2)
11. Flat washer, rear muffler bracket (2)
12. Rear muffler strap fastener
13. Muffler strap, rear (2)
14. Muffler
17. See Figure 3-19. Remove oil filter.
18. Remove all oil lines (including lines to oil cooler).
19. Remove front and rear muffler brackets.
20. Remove left and right side rider footrests and support plates. See \[\text{2.30 FOOTPEG, HEEL GUARD AND MOUNT.}\]

**NOTE**
When removing the right side rider footrest and support plate, also remove rear brake pedal assembly and remote reservoir and secure towards rear of vehicle.

21. See Figure 3-20. Disconnect clutch cable.
   a. Remove upper retaining clamp (1) from front isolator.
   b. Slide clutch cable adjuster boot (2) up to access clutch adjuster.
   c. Loosen clutch adjuster to release tension from hand lever.
   d. Remove clutch cable ferrule from hand lever.

22. See Figure 3-21. Cut cable strap securing sidestand switch harness.

23. See Figure 3-22. Remove sidestand switch, leaving wire attached. Pull switch assembly and wire harness through to right side of vehicle.

24. Remove sidestand assembly.
1. Frame assembly
2. “V” bracket
3. Fasteners for “V” bracket (3)
4. Isolator assembly, front
5. Fasteners for front isolator (2)
6. Bolt, front isolator
7. Tie bar assembly, front
8. Fasteners for front tie bar assembly (2)
9. Nut for one fastener for front tie bar assembly
10. Mount, center tie bar
11. Fasteners for center tie bar mount (2)
12. Washers for center tie bar mount (2)
13. Tie bar assembly, center
14. Fasteners for center tie bar assembly (2)
15. Washers for center tie bar assembly (2)
16. Cable, negative battery
17. Isolator assembly, rear
18. Fasteners for rear isolator assembly (4)
19. Washers for rear isolator assembly (4)
20. Bolt, rear isolator
21. Tie bar assembly, rear
22. Fasteners for rear tie bar assembly (2)

Figure 3-23. Engine Mounting System
CAUTION

Anytime front tie-bar is removed, it must first be removed from the “V” bracket and then the engine. When reinstalling the tie bar, first mount to engine and then to “V” bracket in order to prevent damage to threaded area of crankcase.

25. Support engine with wide scissors jack.
26. See Figure 3-23. Remove front “V” bracket with oil cooler from main frame.
   a. Remove cable strap securing the remote idle adjustment cable
   b. Remove the three cable straps holding regulator wiring harness in order to extend the harness to remove “V” bracket.
   c. See Figure 3-24. Unplug regulator harness, (2 plugs).
      ● Alternator [46].
      ● Voltage regulator [77].
   d. Remove front tie-bar from “V” bracket.
   e. Unbolt “V” bracket from main frame and remove from left side.
27. See Figure 3-20. Remove front tie-bar from engine along with lower retaining clamp.
28. See Figure 3-23. Remove center tie-bar from engine.
29. Remove rear tie bar from frame.
30. Loosen rear isolator bolt.
31. Remove front isolator bolt.
32. Remove front isolator mount from engine.
33. See Figure 3-24. Disconnect electrical components:
   a. Neutral switch [131].
   b. Speedometer sensor [65] (remove cable strap).
   c. Cam position sensor [14].
   d. Positive battery cable at starter.
   e. Starter solenoid [128].
   f. Oil pressure switch [120].
34. Rotate engine down to remove exhaust header.

Figure 3-24. Electrical Connections

1. Neutral switch [131]
2. Speedometer sensor connection [65]
3. Cam position sensor connection [14]
4. Alternator connection [46]
5. Voltage regulator connection [77]
CAUTION

See Figure 3-25. At this point it is necessary to support main frame with overhead hoist in order to remove rear isolator bolt. Failure to do this will result in main frame dropping slightly.

35. See Figure 3-26. After rotating engine back up into frame, continue to remove:
   a. Rear isolator bolt.
   b. Swingarm pivot shaft.

36. See Figure 3-27. Support swingarm/oil tank with wooden blocks, jack, etc.

37. See Figure 3-28. Cut the cable strap holding transmission vent line and pull vent line out of frame leaving it attached to engine.

   NOTE
   The transmission vent line runs up the left side of the frame and exits underneath the left rear side of the intake cover assembly.

38. Lower engine with scissors lift all the way down.
39. Move the engine assembly from under the main frame to the right side of the lift.
40. Remove engine.
41. Once engine has been removed from vehicle finish removing the following items as required:
   a. Shifter assembly.
   b. See Figure 3-29. Center tie bar mount.
   c. See Figure 3-30. Swingarm pivot shaft pinch bolt threaded insert.
   d. See Figure 3-31. Aluminum bushings from front exhaust mount.
   e. Timer cover.

![Figure 3-29. Center Tie Bar Mount](image)

![Figure 3-30. Removing Threaded Insert](image)

![Figure 3-31. Front Exhaust Mount Bushings (2 piece)](image)
42. See Figure 3-32. If the crankcases are being separated it will be necessary to remove rear isolator assembly by removing the forward two fasteners first and then the two rear fasteners (re-install with new fasteners).

43. See Figure 3-33. Place a block of wood between rear isolator mount on main frame and swingarm/oil tank.

44. Route a ratcheting tie down through the swingarm bearings, up over the main frame, through the top stabilizer area, back down to the ratchet mechanism and secure swingarm to main frame.

45. Remove support from under swingarm/oil tank.

46. Remove overhead support.

NOTE
See Figure 3-34. This allows the vehicle to remain together as a rolling chassis and to be removed from the lift and stored if necessary.
ASSEMBLY

Engine Prep for Re-installation

NOTE
Install components that were removed from engine as were necessary for service prior to installing engine in frame.

1. See Figure 3-35. Install rear isolator assembly by installing the two rear fasteners first and then the two forward fasteners (re-install with new fasteners). Tighten to 25-27 ft-lbs (33.9-36.6 Nm).

2. Install the following items on the engine assembly as required:
   a. Shifter assembly.
   b. See Figure 3-36. Center tie bar mount 25-27 ft-lbs (33.9-36.6 Nm).
   c. See Figure 3-37. Swingarm pivot shaft pinch bolt threaded insert.
   d. See Figure 3-38. Aluminum bushings from front exhaust mount.
Installing Engine in Frame

NOTE
Vehicle should be placed onto the lift with rear tire in the wheel vise in order to successfully perform this procedure.

1. See Figure 3-39. Install bottle jack and wooden block under swingarm/oil tank to the rear of the oil line fittings.

2. Remove ratcheting tie down and block of wood between rear isolator mount on main frame and swingarm/oil reservoir.

3. See Figure 3-40. With engine on a flat scissors jack, raise engine and chassis until swingarm and rear isolator mount align and pivot shaft can be installed.

4. Torque swingarm pivot shaft to 24-26 ft-lbs (32.5-35.2 Nm).

5. Torque swingarm pivot shaft pinch bolt to 17-19 ft-lbs (23-25.8 Nm) using LOCTITE 272.

6. See Figure 3-41. Route transmission vent line up through left side of frame exiting under the left rear side of the intake cover assembly. Install cable strap to secure transmission vent line in place. Inspect vent line to verify space between vent line and rear exhaust.

7. See Figure 3-42. At this point it is necessary to support main frame with overhead hoist in order to install rear isolator bolt.

8. See Figure 3-43. Using the overhead hoist to align the frame to the rear isolator, install rear isolator bolt and leave loose at this time.
1. Frame assembly
2. “V” bracket
3. Fasteners for “V” bracket (3)
4. Isolator assembly, front
5. Fasteners for front isolator (2)
6. Bolt, front isolator

11. Fasteners for center tie bar mount (2)
12. Washers for center tie bar mount (2)
13. Tie bar assembly, center
14. Fasteners for center tie bar assembly (2)
15. Washers for center tie bar assembly (2)
16. Cable, negative battery
17. Isolator assembly, rear
18. Fasteners for rear isolator assembly (4)
19. Washers for rear isolator assembly (4)
20. Bolt, rear isolator
21. Tie bar assembly, rear
22. Fasteners for rear tie bar assembly (2)

Figure 3-44. Engine Mounting System
8. Rotate engine down and install exhaust header only and tighten fasteners to 72-96 in-lbs (8.1-10.8 Nm).

**NOTES**
- Tighten header nuts gradually, alternating between studs to insure that exhaust rings are flush with engine.
- Exhaust header must be torqued with the engine rotated in the down position. It is not possible to reach fasteners on the rear exhaust at the head with engine rotated in the up position.

9. When the exhaust header has been torqued, rotate engine back up into frame.

**NOTE**
When tightening front isolator bolt it is important to keep load off of isolator bolt for installation purposes. Alternate between tightening front isolator bolt and raising engine with scissors jack.

10. See Figure 3-46. Insert front isolator bolt (3) through front isolator (1) and loosely thread into frame. Do not tighten at this point.

11. See Figure 3-46. Install isolator mounting fasteners (2) and tighten to 49-51 ft-lbs (66.4-69.1 Nm).

12. Tighten front isolator bolt to 49-51 ft-lbs (66.4-69.1 Nm).

13. See Figure 3-44. Torque rear isolator bolt to 49-51 ft-lbs (66.4-69.1 Nm).

14. See Figure 3-44. Install rear tie bar to frame and tighten to 25-27 ft-lbs (33.9-36.6 Nm).

15. See Figure 3-44. Install center tie bar to engine and tighten to 25-27 ft-lbs (33.9-36.6 Nm).

**CAUTION**
When reinstalling the tie bar, first mount to engine and then to “V” bracket in order to prevent damage to threaded area of crankcase.

16. Install front tie-bar and clutch cable lower retaining clamp to engine and tighten to 25-27 ft-lbs (33.9-36.6 Nm).

17. See Figure 3-44. Install front “V” bracket with oil cooler to main frame.
   a. Install “V” bracket to main frame from the left side of the vehicle and tighten to 120-144 in-lbs (13.6-16.3 Nm).
   b. Install front tie-bar to “V” bracket and tighten to 25-27 ft-lbs (33.9-36.6 Nm).
   c. Attach regulator wiring harness to bracket nylon cable straps.

18. Remove scissors jack.
19. See Figure 3-47. Install rear muffler bracket and torque to 32-36 ft-lbs (43.4-48.8 Nm).

20. Install front muffler mount and leave loose at this time.

**NOTE**

DO NOT install muffler at this time. It is necessary to install muffler mounts first in order to properly install oil lines.
CAUTION

At this point it will be necessary to install the oil lines. It is important to follow this procedure to ensure correct orientation of oil lines in order to establish the proper clearances needed between the oil lines and varied components on the vehicle.

Figure 3-48. Oil Lines and Connections

1. Swingarm/Oil reservoir
2. Vent oil line
3. Feed oil line
4. Return oil line
5. Feed oil line from oil pump to oil cooler
6. Feed oil line from oil cooler to crankcase
7. Oil tank drain plug
8. Oil Filter
9. Front muffler mount
10. Rear muffler bracket
11. Oil cooler
21. See Figure 3-49. Install the return, feed and vent oil lines starting at the swingarm/oil reservoir and working towards the front of the vehicle. Leave all oil line fittings loose at this time.

**NOTE**

*Once the three main oil lines are attached, it will be necessary to follow the proper torquing sequence. The three main oil lines must be torqued at the swingarm/oil reservoir first.*

22. See Figure 3-49. Torque the return oil line first making sure to maintain the proper clearance between the oil line and the rear muffler bracket. 19-21 ft-lbs (25.8-28.5 Nm.)

23. Torque the feed oil line next making sure the distance between the feed line and the return line is within specifications. 20-22 ft-lbs (27.1-29.8 Nm).

24. Torque the vent oil line next making sure the distance between the vent line and the feed line is within specifications. 14-16 ft-lbs (19-21.7 Nm).
25. See Figure 3-50. The feed oil line at the rear of the oil pump should be torqued to 18-20 ft-lbs (24.4-27.1 Nm). When the oil line has been properly torqued, the orientation of the line should be approximately 7 o’clock.

26. Also torque the return oil line at the top front oil pump fitting to 18-20 ft-lbs (24.4-27.1 Nm). When the oil line has been properly torqued, the orientation of the line should also be approximately 7 o’clock.

27. Torque the vent oil line at the gearcase cover to 120-132 in-lbs (13.6-14.9 Nm).

NOTE
When torquing the vent line, verify that the line does not twist down towards the muffler, but remains horizontal and aligned with the feed and return lines after torquing.
CAUTION
The orientation of the oil lines is extremely important to the relation of the oil lines and certain components on the vehicle.

28. See Figure 3-51. Verify that both black plastic oil line clamps are parallel to the crankcases and there is a clearance of 5/16 in. (7.9375 mm) between the bottom of the crankcases and the oil lines.

NOTE
The 5/16 in. clearance is between the crankcase and the steel oil line as shown. Not between the crankcase and the clamp.
29. Loosely install the feed oil line that runs from the lower front oil pump fitting to the rear fitting on the oil cooler.

**NOTE**
Depending on the type of crowsfoot being used to torque the oil lines it may be necessary to remove the oil filter in order to properly torque certain oil line fittings.

See Figure 3-52. It is important to maintain an orientation of approximately 2 o’clock with the rigid part of the feed oil line running to the oil cooler. Also be aware of the 1/8-1/4 (3.175-6.35 mm) clearance specified between the feed oil line and the clutch cable at the front of the crankcase.
NOTE
When torquing the oil cooler feed and return lines to the oil cooler, verify that the lines do not twist while torquing.

30. See Figure 3-54. When torquing the feed oil line from the pump to the oil cooler it is necessary to torque the fitting at the oil pump first, 18-20 ft-lbs (24.4-27.1 Nm), making sure to center the oil line between the oil sending switch and the return oil line fitting on the crankcase.

31. See Figure 3-53. Torque the feed oil line at the oil cooler to 15-17 ft-lbs (20.3-23 Nm).

NOTE
When installing the oil cooler return oil line it is necessary to install the end at the crankcase first.

32. Install the oil cooler return oil line that runs from the crankcase fitting, which is located above and forward of the oil filter, to the front fitting on the oil cooler.

33. Torque the oil cooler return line fitting at the crankcase first to 15-17 ft-lbs (20.3-23 Nm).

NOTE
See Figure 3-54. The orientation of the oil cooler return oil line where it enters the crankcase should be at approximately 4 o’clock to allow for proper alignment and clearance of other components on the vehicle.

34. See Figure 3-53. Finally torque the oil cooler return line fitting on the front of the oil cooler to 15-17 ft-lbs (20.3-23 Nm).

Figure 3-53. Oil Cooler Oil Lines

Figure 3-54. Oil Cooler Feed and Return Oil Lines Location and Orientation
35. See Figure 3-55. Connect the following electrical components:

a. Neutral switch [131].
c. Cam position sensor [14].
d. Alternator [46].
e. Voltage regulator [77].
f. Positive battery cable at starter.
g. Starter solenoid [128].
h. Oil pressure switch [120].
36. See Figure 3-57. Install sidestand assembly. See 2.43 SIDESTAND ASSEMBLY.

37. Pull wire harness and sidestand switch through from right side of vehicle.

38. Install sidestand switch to sidestand assembly and install cable strap.

39. See Figure 3-58. Pull clutch cable back up into the proper position.
   a. Connect clutch cable to handlebars and adjust to specifications. See 3.1 SPECIFICATIONS.
   b. Install upper retaining clamp.
CAUTION

It is important that the front muffler mount is tightened last in order to ensure proper alignment of the exhaust system.

CAUTION

When rear muffler straps have been installed, it is important that strap fasteners do not contact idler pulley bracket.

40. See Figure 3-59. Install muffler with Torca clamp but do not tighten:
   a. Install rear muffler straps (13) and alternately tighten rear strap fasteners (12) until properly torqued to 48-60 in-lbs (5.4-6.8 Nm).
   b. Install front muffler strap fastener (7) and torque to 108-120 in-lbs (12.2-13.6 Nm).
   c. Tighten Torca clamp (1) to 40-45 ft-lbs (54.2-61 Nm).
   d. Tighten front muffler mount (2) to 22-25 ft-lbs (29.8-33.9 Nm).

Figure 3-59. Muffler and Mounting System

1. Clamp, Torca
2. Muffler mount, front
3. Screw, front muffler mount (1)
4. Bushings, front muffler mount (2)
5. Flat washer, front muffler mount (1)
6. Nut, front muffler mount (1)
7. Front muffler strap fastener
8. Muffler strap, front
9. Muffler bracket, rear
10. Screw, rear muffler bracket (2)
11. Flat washer, rear muffler bracket (2)
12. Rear muffler strap fastener
13. Muffler strap, rear (2)
14. Muffler
41. See Figure 3-60. Connect throttle cables to induction module/throttle body.

42. Connect the following sensors:
   a. Temperature sensor [90].
   b. Oxygen sensor [137] (Install wire tie on harness).

43. See Figure 3-60. Install the ignition coil and spark plug wires and connect [83]. Tighten ignition coil fasteners to 120-144 in-lbs (13.6-16.3 Nm).
3-44  2003 Buell XB9S: Engine

1. Fuel line connection
2. Connection for throttle position sensor [88]
3. Connections for fuel injectors [84 & 85]

Figure 3-61. Fuel Line and DDFI Electrical Connections

**CAUTION**

Remove shop towel from entrance of throttle body to ensure proper operation of induction module.

44. See Figure 3-61. Connect throttle position sensor [88].
45. Connect fuel injector leads [84 & 85].
46. Connect fuel line.
47. Install throttle body velocity stack and tighten to 12-36 in-lbs (1.356-4.064 Nm).
48. Install air box cover and assembly. Tighten fasteners to 84-120 in-lbs (9.49-13.56 Nm).
49. Fill oil tank.
50. Connect fuel pump.
51. Install rear belt and idler pulley. See 1.10 DRIVE BELT and 2.13 REAR BRAKE MASTER CYLINDER.
52. Install left and right side rider footrests and support plates and torque to 108-132 in-lbs (12.20-14.91 Nm).

**NOTE**

When re-installing the right side rider footrest and support plate, also install rear brake pedal assembly and remote reservoir.

53. Install sprocket cover and tighten fasteners and washers to 12-36 in-lbs (1-4 Nm).
54. Install chin fairing. See 2.34 CHIN FAIRING.
55. Install air scoops, right and left sides. See 2.36 AIR SCOOPS.

**NOTE**

The connection for fuel pump is just above the pump located at the rear of the fuel tank on the left side of the vehicle.

**WARNING**

Always connect positive battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

56. Connect negative ground cable to battery and install seat (tighten).

**WARNING**

Pull up on seat to verify that it is properly secured, front and rear. A loose seat may shift during vehicle operation and startle the rider, possibly causing loss of vehicle control resulting in death or serious injury.
CAUTION

All washers and fasteners used in the engine are hardened. Do not mix or replace hardened washers and fasteners with unhardened parts. Do not reuse fiber cover seals. Engine damage may result.

REMOVAL

Before removing the cylinder head assembly, it is necessary to rotate engine down as described in 3.3 ENGINE ROTATION FOR SERVICE. The rocker arm covers and internal components must be removed before removing cylinder heads.

1. Crankcase breather
2. Grommet
3. Screw (4)
4. Washer (4)
5. Gasket (4)
6. Rocker cover (top)
7. Bolt (3)
8. Washer (3)
9. Gasket (inner)
10. Gasket (lower)
11. Rocker arm shafts
12. Bolt (2)
13. Washer (2)
14. Rocker cover (lower)
15. Rocker arm (2)
16. Bushing (rocker arm - 4)
17. Gasket (lower rocker cover)
18. Hydraulic lifter
19. Screw, tappet anti-rotation (2)
20. Gasket (push rod cover)
21. Push rod cover
22. Screw (4)
23. O-ring (push rod cover - 2)
24. Push rod
25. Washer (4)
26. Bolt (4)
Rocker Box Assemblies

1. Remove spark plugs.
2. See Figure 3-62. Remove screws with washers and fiber cover seals. Discard fiber seals.
3. Remove top rocker covers.
4. Remove and discard gaskets.
5. Rotate crankshaft until both valves are closed on head being removed.
6. See Figure 3-63. Remove hardware holding lower rocker cover to cylinder head in the following order.
   a. Remove two screws and washers (1).
   b. Remove three bolts and washers (2).
   c. Loosen the four rocker arm fasteners (3) in 1/4-1/2 turn increments using a cross pattern in order to relieve valve spring pressure on the lower rocker box.
7. See Figure 3-62. Remove lower rocker cover.

   NOTE
   Remove lower rocker box as an assembly; then disassemble as required.

   CAUTION
   Mark rocker arm shafts for reassembly in their original positions. Valve train components must be reinstalled in their original positions to prevent accelerated wear and increased valve train noise.

8. See Figure 3-64. Remove rocker arm shafts by tapping them out using a hammer and a soft metal punch.
9. Remove rocker arms; mark them for reassembly in their original locations.
10. Mark the location and orientation (top/bottom) of each push rod. Remove push rods.
CAUTION

See Figure 3-65. Distortion to the head, cylinder and crankcase studs may result if head screws are not loosened (or tightened) gradually in the sequence shown.

11. See Figure 3-65. Loosen each head screw 1/8-turn following the sequence shown.
   a. Continue loosening in 1/8-turn increments until screws are loose. Remove head screws.
   b. Remove cylinder head, head gasket, and O-rings.
12. Discard head gasket.
13. See Figure 3-62. Remove push rod cover, gasket and valve tappets.

DISASSEMBLY

1. See Figure 3-66. Clamp VALVE SPRING COMPRESSOR TOOL (Part No. HD-34736B) in vise.
2. See Figure 3-66. Compress valve spring with VALVE SPRING COMPRESSOR.
3. See Figure 3-67. Remove valve keepers, upper collar and valve spring. Mark valve keepers for reassembly in their original locations.
4. Use a fine tooth file to remove any burrs on the valve stem at the keeper groove.
5. Mark valve to ensure that it will be reassembled in the same head. Remove valve, valve stem seal and lower collar assembly by hand. No special tools are required to remove valve stem seal and lower collar assembly.
6. Repeat the above procedure for the other valves.
1. Screw
2. Screw
3. Valve collar retainer
4. Upper valve spring collar
5. Valve spring
6. Valve seal and lower valve spring collar assembly
7. Valve guide intake & exhaust (2)
8. Cylinder head
9. Exhaust port stud
10. Cylinder head gasket
11. Cylinder O-ring (4)
12. Cylinder insert
13. Cylinder w/piston & rings
14. Cylinder base gasket
15. Cylinder base stud
16. Exhaust valve
17. Exhaust valve seat

Figure 3-67. Cylinder Head, Cylinder and Piston Assembly
Cylinder Heads

**WARNING**

Low pressure compressed air can blow debris into your face and eyes. Always wear eye protection or a face shield when using pressurized air. Failure to take adequate safety precautions could result in death or serious injury.

1. Bead blast or scrape carbon from head, top of cylinder and valve ports. Be careful to avoid scratching or nicking cylinder head and cylinder joint faces. Blow off loosened carbon or dirt with compressed air.

3. Wash all parts in non-flammable solvent, followed by a thorough washing with hot, soapy water. Blow out oil passages in head. Be sure they are free of sludge and carbon particles. Remove loosened carbon from valve head and stem using a wire wheel. Never use a file or other hardened tool which could scratch or nick valve. Polish valve stem with very fine emery cloth or steel wool.

4. See Figure 3-68. Check head gasket surface on head for flatness. Machine or replace any head which exceeds SERVICE WEAR LIMIT of 0.006 in. (0.152 mm).
Rocker Arm Assemblies

1. Check each rocker arm, at pad end and push rod end, for uneven wear or pitting. Replace rocker arm if either condition exists.

2. Measure and record rocker arm shaft diameter.
   a. See Figure 3-69. Measure where shaft fits in lower rocker arm cover.
   b. See Figure 3-70. Measure where rocker arm bushings ride.

3. Measure and record rocker arm shaft bore diameter.
   a. See Figure 3-71. Measure bore of lower rocker cover.
   b. See Figure 3-72. Measure rocker arm bushing inner diameter.

4. Check the measurements obtained in Steps 5-6 against the SERVICE WEAR LIMITS. Repair or replace parts exceeding limits.

5. Assemble rocker arms and rocker arm shafts into lower rocker cover.

6. Check end play of rocker arm with feeler gauge.

7. Replace rocker arm or lower cover or both if end play exceeds 0.025 in. (0.635 mm).
Valves

1. Replace the valve if there is evidence of burning or cracking.
2. Inspect the end of the valve stem for pitting or uneven wear. Replace the valve if either of these conditions are found.
3. Inspect for burrs around the valve stem keeper groove. Remove burrs with a fine tooth file if found.

Valve Seats

- **Valve seats are also subject to wear. Resurface valve seats whenever valves are refinished.**

1. Inspect seats for cracking, chipping or burning. Replace seats if any evidence of these conditions are found.

Valve Guides

1. Clean valve guides by lightly honing with VALVE GUIDE HONE (Part No. HD-34723).
2. Scrub guides with VALVE GUIDE BRUSH (Part No. HD-34751) and hot soapy water. Measure valve stem outer diameter and valve guide inner diameter. Check measurements against 3.1 SPECIFICATIONS.

Valve Springs

1. Inspect valve springs for broken or discolored coils.

- **Note**
  The XB9S utilizes a single valve spring for each valve. The inner and outer springs are combined into one tapered spring that is progressively wound.

Valve Seats

1. Inspect seats for cracking, chipping or burning. Replace seats if any evidence of these conditions are found.

2. See Figure 3-73. Check seats for recession by measuring valve stem protrusion.
   a. Wipe valve seats and valve faces clean.
   b. Measure valve stem protrusion.
   c. If valve stem protrudes more than 2.031 in. (51.587 mm), replace valve seat or cylinder head.

- **Note**
  Replacing a valve seat is a complex operation requiring special equipment. If the seat is loose or is not fully seated in the head, then seat movement will prevent the proper transfer of heat from the valve. The seat surface must be flush with (or below) the head surface. See 3.1 SPECIFICATIONS for valve seat-to-cylinder head fit.

Figure 3-73. Measuring Valve Stem Protrusion

Figure 3-74. Checking Spring Free Length

2. See Figure 3-74. Check free length and compression force of each spring. Compare with 3.1 SPECIFICATIONS. If spring length is shorter than specification or if spring compression force is below specification, replace spring.

Spark Plug Threads

Inspect spark plug threads for damage. If threads in head are damaged, a special plug type insert can be installed using a 12 mm spark plug repair kit.

Push Rods

Examine push rods, particularly the ball ends. Replace any rods that are bent, worn, discolored or broken.
Replacing Rocker Arm Bushings

1. See Figure 3-75. To replace worn bushings, press or drive them from the rocker arm. If bushing is difficult to remove, turn a 9/16-18 tap into bushing. From opposite side of rocker arm, press out bushing and tap using a discarded rocker arm shaft.

2. Press replacement bushing into rocker arm, flush with arm end, and split portion of bushing towards top of arm.

3. Using remaining old bushing as a pilot, line ream new bushing with ROCKER ARM BUSHING REAMER (Part No. HD-94804-57).

4. Repeat for other end of rocker arm.
Replacing Valve Guides

Valve guide replacement, if necessary, must be done before valve seat is ground. It is the valve stem hole in valve guide that determines seat grinding location. Valve stem-to-valve guide clearances are listed in Table 3-19. If valve stems and/or guides are worn beyond limits, install new parts.

Table 3-19. Valve Stem Clearances and Service Wear Limits

<table>
<thead>
<tr>
<th>VALVE</th>
<th>CLEARANCE</th>
<th>SERVICE WEAR LIMIT</th>
</tr>
</thead>
<tbody>
<tr>

<td>(0.0889 mm)</td>
</tr>
</tbody>
</table>

1. To remove shoulderless guides, press or tap guides toward combustion chamber using VALVE GUIDE REMOVER/INSTALLER (Part No. B-45524).
2. Clean and measure valve guide bore in head.
3. Measure outer diameter of a new standard valve guide. The guide diameter should be 0.0020-0.0033 in. (0.0508-0.0838 mm), larger than bore in head. If it is not, select one of the following oversizes: +0.001 in. (+0.025 mm), +0.002 in. (+0.051 mm) or +0.003 in. (+0.076 mm) (intake and exhaust).
4. See Figure 3-76. Install shoulderless guides using VALVE GUIDE REMOVER/INSTALLER TOOL (Part No. B-45524). Press or drive guide until the tool touches the machined surface surrounding the guide. At this point, the correct guide height has been reached.
5. Ream guides to final size or within 0.0010 in. (0.0254 mm) of final size using VALVE GUIDE REAMER (Part No. B-45523). Use REAMER LUBRICANT (Part No. HD-39964) or liberal amounts of suitable cutting oil to prevent reamer chatter.

**NOTE**
The hone is not intended to remove material.
6. Apply the proper surface finish to the valve guide bores using the VALVE GUIDE HONE (Part No. B-45525). Lubricate hone with honing oil. Driving hone with an electric drill, work for a crosshatch pattern with an angle of approximately 60°.
7. See Figure 3-77. Thoroughly clean valve guide bores using VALVE GUIDE BRUSH (Part No. HD-34751) and hot soapy water.
PROCEDURE FOR USING THE NEWAY VALVE SEAT CUTTER

Table 3-20. Neway Valve Seat Cutter

<table>
<thead>
<tr>
<th>PART NO.</th>
<th>SPECIALTY TOOL</th>
</tr>
</thead>
<tbody>
<tr>
<td>HD-35758A</td>
<td>Neway valve seat cutter</td>
</tr>
<tr>
<td>HD-39786</td>
<td>Cylinder head holding fixture</td>
</tr>
</tbody>
</table>

1. Secure cylinder head for service.
   a. Thread 12 mm end of CYLINDER HEAD HOLDING FIXTURE (Part No. HD-39786) into cylinder head spark plug hole.
   b. Clamp tool in vise and further tighten cylinder head onto the fixture to prevent any movement during operation.
   c. Place cylinder head at a 45° angle or one that offers a comfortable working position.

2. Obtain the NEWAY VALVE SEAT CUTTER SET (HD-35758A) and cut valve seat angle to 46°. Do not remove any more metal than is necessary to clean up the seat (that is, to provide a uniform finish and remove pitting).

3. In order to determine the correct location of the 46° valve seat in the head, measure the width of the valve to be used and subtract 0.080" (2.032 mm) from that number.

4. Set your dial caliper to the lesser measurement and lock down for quick reference. This is the location of your valve seat.

5. Use a permanent magic marker to highlight the valve seat area that is going to be cut and be sure to highlight all 3 angles. Allow marker to dry before proceeding.

   NOTE
   ● Always ensure cutter blades and cutter pilot are clean before beginning the cutting process. The correct cleaning brush is supplied with the Neway tool set.
   ● Also ensure the inside of the valve guide is clean by using Kent-Moore cleaning brush (Part No. HD-34751).

6. Choose the cutter pilot that fits properly into the valve guide hole and securely seat the pilot by pushing down and turning using the installation tool supplied in the tool set.

7. Choose the proper 46° cutter (intake or exhaust) and gently slide the cutter onto the pilot being careful not to drop the cutter onto the seat.

8. While applying a constant and consistent pressure, remove just enough material to show a complete clean-up on the 46° angle.

   NOTES
   ● If the width of the clean-up angle is greater on one side of the seat than the other, the guide may need to be replaced due to improper installation.
   ● After making the 46° cut, if you discover a groove cut completely around the seat this means the blades of the cutter are in alignment and need to be staggered. This is accomplished by loosening all of the blades from the cutter body and moving each blade slightly in it's cradle in opposite directions on the cutter. The tool needed to loosen the blades is supplied in the tool set. A permanent magic marker mark every 90° will help in determining where new angles are.
9. Next, with your dial caliper locked to the predetermined setting, measure the 46° cut at the outer most edge at the widest point of the circle to determine what cut needs to be made next.
   a. If the 46° cut is to high (towards the combustion chamber), use the 31° cutter to lower the valve seat closer to the port.
   b. If the 46° cut is too low, use the 60° cutter to raise the valve seat or move it away from the port.

**NOTES**

- **Due to using the top measurement of our valve seat as a reference point it will usually be necessary to use the 31° cutter following the initial 46° cut.**
- **Always highlight the valve seat with the permanent magic marker in order to ensure the location of the 46° valve seat.**

10. If the location of the valve seat is not correct, repeat steps 8 and 9.

11. When you accomplish a complete clean-up of the 46° angle and the width is at least 0.062 in. (1.575 mm), proceed to the next step.

12. Select the proper 60° cutter and gently slide the cutter down the cutter pilot to the valve seat.

13. Remove just enough material to provide an even valve seat width of 0.040-.062 in. (1.016-1.575 mm).

14. Remove cutter pilot and wash head thoroughly and dry completely.

15. Repeat the process on any valve seat that needs service.

16. Insert valve to be used in the valve guide and bottom on the valve seat. Positioning the cylinder head port upwards and with slight thumb pressure against the valve, completely fill the port with solvent to verify proper seal between the valve and the valve seat.

   **NOTE**

   Hold pressure against the valve for a minimum of 10 seconds. If any leakage occurs, examine the valve seat for irregularities or defects and if necessary repeat the above cutting process.

---

**Intake & Exhaust Valve and Seat**

14. Cylinder base gasket
15. Cylinder base stud
16. Exhaust valve
17. Exhaust valve seat

Figure 3-80. Cylinder Head, Cylinder and Piston Assembly
ASSEMBLY

1. Wash cylinder head and valves in warm, soapy water to remove all debris from cutting valve seats.
2. Scrub valve guide bores with VALVE GUIDE BRUSH (Part No. HD-34751) and hot, soapy water.

**WARNING**

Low pressure compressed air can blow debris into your face and eyes. Always wear eye protection or a face shield when using pressurized air. Failure to take adequate safety precautions could result in death or serious injury.

3. Blow dry with compressed air.
4. Apply a liberal amount of engine oil to the valve stem.
5. See Figure 3-80. Insert valve into valve guide and bottom valve on valve seat.

![Figure 3-81. Valve Guide Seal Protector Sleeve](image)

6. See Figure 3-81. Place a protective sleeve over the valve stem keeper groove.

**CAUTION**

Failure to use a protective sleeve on the valve stem keeper groove when installing the valve stem seal and collar assembly will result in damage to the seal causing leakage around the valve stem, excessive oil consumption and valve sticking.

![Figure 3-82. Valve Seal and Lower Collar Assembly](image)
7. See Figure 3-83. Coat the sleeve with oil and place a new seal and lower collar assembly over the valve stem and onto valve guide.

   NOTE
   ● See Figure 3-82. The valve seal is now incorporated into the lower collar and is installed by hand. NO SPECIAL TOOLS ARE REQUIRED.
   ● The seal is completely installed when the lower collar contacts the machined surface of the head.

   CAUTION
   Do not remove valve after seal is installed. Otherwise, sharp edges on keeper groove will damage seal.

8. Install valve spring and upper collar.

9. See Figure 3-84. Compress spring with VALVE SPRING COMPRESSOR (Part No. HD-34736B).

   NOTE
   The XB9S utilizes a single valve spring for each valve. The inner and outer springs are combined into one tapered spring that is progressively wound.

10. Insert valve keepers into upper collar, making sure they engage grooves in valve stem. The keeper gaps should be equal.

11. Release and remove from VALVE SPRING COMPRESSOR.

12. Repeat Steps 4-11 for the remaining valve.
PUSH ROD COVER INSTALLATION

NOTE
Push rod covers must be installed prior to installing cylinder heads.

1. See Figure 3-86. Install push rod covers.
   a. Install **new** o-rings (2) on top of each push rod cover (3).
   b. Install **new** push rod cover gasket (5) onto bottom of each push rod cover.
   c. Install each push rod cover assembly and start the fasteners (4) securing the bottom of each cover to the crankcase.
   d. Tighten fasteners to 30-40 in lbs (3.4-4.5 Nm).

2. Refer to Table 3-21. Identify push rod color coding, length and respective push rod positions in engine. Place intake and exhaust push rods onto seat at top of tappet.

</tr>
</tbody>
</table>

CAUTION
After head(s) have been installed do not turn engine over until both push rods can be turned with fingers. Otherwise, damage to push rods or rocker arms may result.
CAUTION

Thoroughly clean and lubricate the threads of the cylinder head screws before installation. Friction caused by dirt and grime will result in a false torque indication.

1. Thoroughly clean and dry the gasket surfaces of cylinders and cylinder heads.

2. Install new O-rings over two ring dowels at the top of the cylinder. Apply a very thin film of clean H-D 20W50 engine oil to O-rings before installation.

CAUTION

To ensure proper head gasket alignment, install new O-rings over cylinder ring dowels before installing the head gasket. Improper head gasket alignment will cause leaks.

3. Install a new head gasket to cylinder.

4. Carefully lower cylinder head over studs and position on dowels. Use great care so as not to disturb head gasket.

5. Lightly coat the threads and bottom face of the cylinder head bolts in clean H-D 20W50 engine oil. Wipe off any excess oil.

CAUTION

The procedure for tightening the head screws is critical to proper distribution of pressure over gasket area. It prevents gasket leaks, stud failure, and head and cylinder distortion.

6. Start the cylinder head screws onto the cylinder studs, two short bolts on the left side of the engine, two long bolts on the right.

7. See Figure 3-87. For each cylinder head, start with screw numbered one, as shown. In increasing numerical sequence (i.e. – 1, 2, 3 and 4):
   a. Tighten bolts to 96-120 in-lbs (11-14 Nm).
   b. Tighten bolts to 13-15 ft-lbs (18-20 Nm).
   c. Loosen all screws.

8. After screws are loosened from initial torque, tighten head screws in three stages. Tighten fasteners in increasing numerical sequence (i.e. – 1, 2, 3 and 4).
   a. Tighten each screw to 96-120 in-lbs (11-14 Nm).
   b. Tighten each screw to 13-15 ft-lbs (18-20 Nm).
   c. See Figure 3-88. Mark cylinder head and head screw shoulder with a line as shown (View A).
   d. Turn all bolts an additional 85°-95°.

26. Bolt (4)

Figure 3-89. Rocker Arm and Push Rod Cover Assemblies
9. See Figure 3-90. Install new gaskets with the bead facing up. Place lower rocker box assembly (with rocker arms and shafts) into position. Place push rods in rocker arm sockets.

10. See Figure 3-90. Install hardware attaching lower rocker cover to cylinder head in the following order. After loosely installing all fasteners, use a cross pattern on the four large bolts that fasten the lower rocker box to head to tighten and then torque to specifications. This will bleed the tappets. Finish tightening remaining fasteners. Fastener sequences, sizes and torque specifications are listed in Table 3-22.

   a. Tighten bolts (1) to 18–22 ft-ibs (24–30 Nm).
   b. Tighten bolts (2) to 135–155 in-lbs (15–18 Nm).
   c. Tighten bolts (3) to 135–155 in-lbs (15–18 Nm).

11. See Figure 3-89. Install upper rocker covers.

   a. Place a new inner gaskets on lower rocker box assemblies.
   b. Place a new lower gaskets on lower rocker cover.
   c. Install upper rocker cover using screws with washers and new fiber seals. Tighten screws to 10–14 ft-lbs (13.6–19 Nm).

REMOVAL/DISASSEMBLY

1. Strip motorcycle as described under 3.4 STRIPPING MOTORCYCLE FOR ENGINE SERVICE.

2. Remove cylinder head. See 3.6 CYLINDER HEAD.

3. Clean crankcase around cylinder base to prevent dirt and debris from entering crankcase while removing cylinder.

4. See Figure 3-91. Turn engine over until piston of cylinder being removed is at bottom of its stroke.

5. Carefully raise cylinder just enough to permit placing clean towel under piston to prevent any foreign matter from falling into crankcase.

   **NOTE**

   If cylinder does not come loose, lightly tap a plastic hammer perpendicular to the cylinder fins. Never try to pry a cylinder up.

   **CAUTION**

   With cylinder removed, be careful not to bend the cylinder studs. The slightest bend could cause a stress riser and lead to stud failure.

7. Install a 6 in. (152 mm) length of 1/2 in. (12.7 mm) ID plastic or rubber hose over each cylinder stud. This will protect the studs and the piston.

   **WARNING**

   Retaining rings are highly compressed in the ring groove and may “fly out” with considerable force when pried out. Always wear safety glasses or goggles when removing or installing retaining rings. Failure to wear safety glasses or goggles could result in death or serious injury.

   **CAUTION**

   DO NOT re-use piston pin retaining rings. Removal may weaken retaining rings and they may break or dislodge if reinstalled resulting in engine damage.

---

**Figure 3-91. Cylinder and Piston**

1. Ring set
2. Piston
3. Piston pin
4. Retaining ring (2)
5. Dowel and o-ring
6. Cylinder
7. Base gasket
8. Cylinder stud (4)
9. Connecting rod
10. Piston pin bushing
CAUTION

Handle the piston with extreme care. The alloy used in these pistons is very hard. Any scratches, gouges or other marks in the piston could score the cylinder during engine operation and cause engine damage.

NOTES

- It is not necessary to remove both piston pin circlips during piston removal. Leave the second circlip in the pin bore.
- Since the piston pin is a loose fit in the piston, the pin will easily slide out. The pin has tapered ends to help seat the round retaining rings.

8. See Figure 3-92. Remove the piston pin circlip as follows:
   a. Insert the PISTON PIN CIRCLIP REMOVER/INSTALLER (Part No. HD-34623C) into the piston pin bore until claw on tool is positioned in slot of piston (directly under circlip).
   b. Squeeze the handles of the tool together and pull from bore. In the event that the circlip should fly out, hold a shop towel over the bore during removal. Remove circlip from claw and discard.

9. See Figure 3-94. To remove piston rings spread outward until they clear grooves in piston and lift off.
Low pressure compressed air can blow debris into your face and eyes. Always wear eye protection or a face shield when using pressurized air. Failure to take adequate safety precautions could result in death or serious injury.

1. Soak cylinder and piston in an aluminum-compatible cleaner/solvent until deposits are soft, then clean with a brush. Blow off loosened carbon and dirt particles and wash in solvent.

2. Clean oil passage in cylinder with compressed air.

3. Clean piston ring grooves with a piece of compression ring ground to a chisel shape.

4. Examine piston pin to see that it is not pitted or scored.

5. Check piston pin bushing to see that it is not loose in connecting rod, grooved, pitted or scored.
   a. A piston pin properly fitted to upper connecting rod bushing has a 0.00125-0.00175 in. (0.03175-0.04445 mm) clearance in bushing.
   b. See Connecting Rod Bushing section. If piston pin-to-bushing clearance exceeds 0.00200 in. (0.05080 mm), replace worn parts.

6. Clean piston pin retaining ring grooves.

7. Examine piston and cylinder for cracks, burnt spots, grooves and gouges.

8. Check connecting rod for up and down play in lower bearings. When up and down play is detected, lower bearing should be refitted. This requires removing and disassembling engine crankcase.

Checking Gasket Surface

If cylinder gasket surface does not meet flatness specifications, replace cylinder and piston. Proper tolerances will extend component life and prevent leaks.

1. See Figure 3-95. Check cylinder head gasket surface for flatness.
   a. Lay a straightedge across the surface.
   b. Try to insert a feeler gauge between the straightedge and the gasket surface.
   c. If cylinder head gasket surface is not flat within 0.006 in. (0.152 mm), replace cylinder and piston.

2. Check cylinder base gasket surface for flatness.
   a. Lay a straightedge across the surface.
   b. Try to insert a feeler gauge between the straightedge and the gasket surface.
   c. If cylinder base gasket surface is not flat within 0.008 in. (0.203 mm), replace cylinder and piston.
Measuring Cylinder Bore

1. Remove any burrs from the cylinder gasket surfaces.

2. See Figure 3-96. Install a head gasket, base gasket and O-rings, and CYLINDER TORQUEPLATES (Part No. HD-33446B) and XL EVOLUTION TORQUE PLATE BOLTS (Part No. HD-33446-86). Tighten the bolts using the same method used when installing the cylinder head screws. See 3.6 CYLINDER HEAD.

NOTE
Torque plates, properly tightened and installed with gaskets, simulate engine operating conditions. Measurements will vary as much as 0.001 in. (0.025 mm) without torque plates.

Figure 3-96. Measuring Cylinder Bore Using Torque Plates (Part No. HD-33446B)

3. See Figure 3-96. Take cylinder bore measurement in ring path, starting about 0.50 in. (12.7 mm) from top of cylinder, measuring from front to rear and then side to side. Record readings.

4. Repeat measurement at center and then at bottom of ring path. Record readings. This process will determine if cylinder is out-of-round and will also show any cylinder taper or bulge.

5. See Table 3-23. If cylinder is not scuffed or scored and is within service limit, see next section, DEGLAZING CYLINDER.

NOTE
If piston clearance exceeds service wear limit, cylinders and pistons should be replaced with new components. See 3.1 SPECIFICATIONS.

Table 3-23. Cylinder Bore Service Wear Limit

<table>
<thead>
<tr>
<th>BORE SIZES</th>
<th>IN.</th>
<th>MM</th>
</tr>
</thead>
<tbody>
<tr>
<td>Standard Bore</td>
<td>3.5008</td>
<td>88.9203</td>
</tr>
</tbody>
</table>

Deglazing Cylinder

NOTE
Deglazing removes wear patterns, minor scuff marks and scratches without enlarging the bore diameter.

1. Lightly swab the cylinder bore with a cloth dipped in clean engine oil.

2. Obtain a 240 grit flexible ball-type deglazing tool with a bristle tip or finishing stone arrangement able to produce a 60° cross hatch pattern.

3. Install the deglazing tool in a slow-speed drill. The speed at which the tool rotates determines the speed at which it must be stroked up and down the bore to produce the desired cross hatch pattern.

4. Starting at the bottom of the cylinder, move the deglazing tool up and down the entire length of the cylinder bore for 10 to 12 complete strokes.

NOTE
Stop to examine the cylinder bore and/or take measurements. A precise 60° cross hatch pattern in the piston travel area is the most important.

CAUTION
The angular cross hatch pattern ensures an even flow of oil onto the cylinder walls and promotes longer cylinder, piston and ring life. An improper cross hatch pattern will result in insufficient oil retention and possible piston seizure and/or high oil consumption.

CAUTION
Failure to remove all abrasive particles may result in premature cylinder, piston and ring wear and possible engine failure.

5. Thoroughly wash the cylinder bore with liquid dishwashing soap and warm water to remove all abrasive particles and residual grit. Continue cleaning until a clean cloth shows no evidence of dirt or debris.

6. Hot rinse the cylinder and dry with moisture free compressed air.

7. Immediately apply a thin film of clean engine oil to a clean white paper towel and thoroughly wipe the inside of the cylinder.

NOTE
After wiping the cylinder with a clean, oiled paper towel, the towel will be dark with contamination. Repeat this process using a new lightly oiled paper towel each time until the towel remains white. The cylinder is now clean.

8. With the cylinder at room temperature, check the piston clearance in the cylinder in which the piston will run. See 3.1 SPECIFICATIONS.
Fitting Piston Rings

See Figure 3-97. Piston rings are of two types: compression and oil control. The two compression rings are positioned in the two upper piston ring grooves. The dot on the second compression ring must face upward. Ring sets are available to fit standard and oversize pistons.

1. Top compression ring – Install either side up
2. Second compression ring – Install dot toward top
3. Oil control rings

See Figure 3-98. Piston ring sets must be properly fitted to piston and cylinder:

Insert the new ring into the cylinder, square it in the bore using the top of the piston and measure the ring end gap with a feeler gauge. Do not use the ring if the end gap does not fall within the following specifications, See Table 3-24.

Table 3-24. Piston Ring End Gap

<table>
<thead>
<tr>
<th>Ring Type</th>
<th>Ring End Gap</th>
<th>inches</th>
<th>mm</th>
</tr>
</thead>
<tbody>

<td>0.36-0.61</td>
<td></td>
</tr>
<tr>
<td>Oil control ring rails</td>
<td>0.010-0.050</td>
<td>0.25-1.27</td>
<td></td>
</tr>
</tbody>
</table>
NOTE
The same piston may be used if cylinder bore was not changed, unless it is scuffed or grooved. If re-using piston, replace piston rings and hone the cylinder walls with a No. 240 grit flexible hone to facilitate ring seating.

9. See Figure 3-99. Apply engine oil to piston grooves. Use TRANSMISSION SHAFT RETAINING RING PLIERS (Part No. J-5586) to slip compression rings over piston into their respective grooves. Be extremely careful not to over expand, twist rings or damage piston surface when installing rings.

NOTE
Install second compression ring with dot towards top.

10. See Figure 3-100. Install rings so end gaps of adjacent rings are a minimum of 90° apart. Ring gaps are not to be within 10° of the thrust face centerline.

NOTE
If the ring grooves are clean and the side play is still not correct, replace the rings, the piston or both.
Connecting Rod Bushing

REMOVAL/INSTALLATION

When connecting rod bushing is worn to excessive pin clearance (0.002 in. or more) (0.051 mm) it must be replaced.

1. See Figure 3-102. Secure connecting rod with CONNECTING ROD CLAMPING TOOL (Part No. HD-95952-33B).

2. See Figure 3-103. Attach PISTON PIN BUSHING TOOL (Part No. HD-95970-32D) to the connecting rod.

NOTE
See Figure 3-104. The receiver cup fits on one side of the rod while the driver fits on the opposite side as shown.

3. Use two box wrenches and push worn bushing from connecting rod.

4. Remove piston pin bushing tool from connecting rod.

5. Remove bushing from receiver cup.

6. See Figure 3-105. Place new bushing between connecting rod and driver.

NOTE
The driver must be attached facing the opposite direction as it was for removal of the bushing.

7. Clean up and size bushing to 0.0010-0.0005 in. (0.0254-0.0127 mm) undersize using REAMER (Part No. HD-94800-26A). Sizing bushing with less than 0.00125 in. (0.03175 mm) clearance can result in a bushing loosening and/or seized pin in rod.

8. Hone bushing to final size using WRIST PIN BUSHING HONE (Part No. HD-35102). Use a liberal amount of honing oil to prevent damage to hone or bushing. Use care to prevent foreign material from falling into the crankcase.
ASSEMBLY/INSTALLATION

1. See Figure 3-106. Place PISTON SUPPORT PLATE (Part No. HD-42322) in position as shown.

![Figure 3-106. Piston Support Plate (Part No. HD-42322)](image1)

2. Install piston assembly over connecting rod.

![Figure 3-107. Piston Pin and Piston Identification](image2)

3. Install piston pin.

   - **NOTE**: Piston must be installed with the arrow, at the top of the piston, pointing towards the front of the engine.

4. See Figure 3-108. Install new piston pin retaining rings (1) using PISTON PIN RETAINING RING INSTALLER (2) (Part No. HD-34623C). Place new retaining ring on tool with gap pointing up.

   - **NOTE**: Make sure the ring groove is clean. Ring must be fully seated in the groove with the gap away from the slot at the bottom.

   - **CAUTION**: Always use new retaining ring. Make sure retaining ring groove is clean and that ring seats firmly in groove. If it does not, discard the ring. Never install a used retaining ring or a new one if it has been installed and then removed for any reason. A loosely installed ring will come out of the piston groove and damage cylinder and piston beyond repair.
Position ring end gaps at arrows—minimum of 90° apart

5. See Figure 3-109. Make sure the piston ring end gaps are properly positioned as shown.

Figure 3-109. Ring End Gap Position

6. See Figure 3-110. Turn engine until piston is resting on top of PISTON SUPPORT PLATE (Part No. HD-42322).
7. Lubricate cylinder wall, piston, pin and rod bushing with engine oil.
8. Remove protective sleeves from cylinder studs. Install a new cylinder base gasket. Make sure the piston does not bump the studs or crankcase.

Figure 3-110. Piston Support Plate

9. See Figure 3-111. Compress the piston rings using PISTON RING COMPRESSOR (Part No. HD-96333-51C).
10. Install cylinder over piston.
11. Remove PISTON RING COMPRESSOR.
12. Assemble and install cylinder head. See 3.6 CYLINDER HEAD.
13. Install assembled engine. See 3.4 STRIPPING MOTORCYCLE FOR ENGINE SERVICE.
CHECKING AND ADDING OIL

Check engine oil level in oil reservoir at least once every 500 miles (800 km). Check level more frequently if engine uses more oil than normal or if vehicle is operated under harsh conditions. Check oil when engine is warmed up to operating temperature (see Hot Check).

CHANGING OIL AND FILTER

After a new engine has run its first 1000 miles (1600 km) and at 5000 miles (8000 km) intervals or annually thereafter, completely drain oil reservoir of used oil. If riding habits include severe dust conditions, operation at temperature above 80°F (26.7°C), extensive idling, speeds in excess of 65 mph (105 kph) and/or extensive two up riding or similar loads the oil should be changed at 2500 mile (4000 km) intervals. Refill with fresh oil. Always change oil filter when changing engine oil.

NOTE

See 1.6 ENGINE LUBRICATION SYSTEM for more information on checking oil level and changing oil and filter.

WINTER LUBRICATION

Normal fuel combustion in a gasoline engine produces water vapor and carbon dioxide along with other gases and particulates. When first starting and warming an engine, some of the water vapor that gets into the engine crankcase condenses to form liquid water. If the engine is driven long enough to thoroughly warm the crankcase, most of this liquid water is again vaporized and exhausted through the crankcase breather system.

A moderately driven vehicle making short runs may not be able to vacate water vapors allowing liquid water to accumulate in the oil reservoir. This is especially true if the vehicle is operated in cold weather. In freezing weather, an accumulation of water in the engine oil may become slush or ice, which can block oil lines and lead to severe engine damage. Water remaining in the engine oil for long periods of time can form an acidic sludge that is corrosive to metal engine parts and causes accelerated wear of moving components.

In winter the oil change interval should be shorter than normal. The colder the weather, the shorter the recommended oil change interval. A vehicle used only for short runs in cold weather must have the engine oil drained frequently.
GENERAL

See Figure 3-112. Engine oil runs through the swingarm which serves as the oil reservoir. From the front of the reservoir, the vent hose, the return hose and the feed hose run downward below the crankcases. Two rubberized clamps secure the hoses in place.

The feed line exits the front of the oil pump and routes across the front of the engine to the oil cooler on the left front side of the crankcases. The feed line then exits the oil cooler and connects to the oil filter housing on the right front side of the crankcases.

The vent hose continues upward from under the vehicle to connect to an elbow fitting at the rear of the gearcase cover.
GENERAL

The oil pressure indicator switch is a pressure-actuated diaphragm-type switch. When oil is not circulating through the system or when oil pressure is low, spring tension holds the switch contacts closed, thereby completing the signal light circuit and causing the indicator lamp to illuminate.

OIL PRESSURE SIGNAL LIGHT

The oil pressure signal light turns ON when:

- Ignition switch is turned on prior to starting engine.
- Oil is not circulating through the running engine.
- Oil pressure is abnormally low in the running engine.
- Engine is idling below 1000 RPM.

The oil pressure signal light turns OFF when:

- Oil is circulating with adequate pressure through the engine running at 1000 RPM or greater.

Troubleshooting information is listed in Table 3-25.

NOTE

If the ignition is turned back on immediately after the engine is stopped, the oil light may not turn on right away because of oil pressure retained in the filter housing.

OIL PRESSURE

See Figure 3-113. The oil pump is non regulatory and delivers its entire volume of oil under pressure to the oil filter mount. When an engine is cold, the engine oil will be more viscous (i.e., thicker).

When an engine is operated at high speeds, the volume of oil circulated through the oiling system increases, resulting in higher oil pressure. As engine speed is reduced, the volume of oil pumped is also reduced, resulting in lower oil pressure.

To check oil pressure, use OIL PRESSURE GAUGE (Part No. HD-96921-52B) and OIL PRESSURE GAUGE ADAPTER (Part No. HD-96940-58). Remove oil pressure indicator switch and insert pressure gauge fitting.

Ride motorcycle at least 20 miles (32 km) at or above 50 MPH (80 KM/H) until engine oil reaches normal operating temperature. At 2500 RPM, oil pressure will vary from 10-12 psi (69-83 KPa). At idle speed (950-1050 RPM), oil pressure will vary from 6-8 psi (42-55 KPa).

Table 3-25. Troubleshooting Oil Pressure Signal Light

| Dead battery (see NOTE). |
GENERAL

See Figure 3-114. Pressure created in the flywheel area on piston downstroke is released through the reed valve into the gearcase. From there a mixture of crankcase air and oil mist is vented up the push rod covers to the upper rocker box.

See Figure 3-115. Air is allowed to escape the rocker boxes by exiting the positive crankcase vent (PCV) valves (4) located on top of the rocker boxes. From the PCV valves the air enters the crankcase breather hoses (2 & 3). The crankcase breather hoses route through the air cleaner base plate (1) to the air box where it is directed inside the air filter element and back into the engine.

The oil mist collects and eventually returns to the crankcase through oil passageways in the cylinder head.

Figure 3-114. Reed Valve Assembly in Gearcase

Figure 3-115. Crankcase Breathing System
NOTE
See Figure 3-117. Whenever the gearcase cover is removed, the reed valve should always be inspected for cracks, chips and breakage. The reed valve (2) is what moves out with the downstroke and in with the upstroke of the pistons. The reed valve stop (1) limits the movement the reed valve (2). See 3.11 CRANKCASE BREATHING SYSTEM.

Fasteners should be tightened to 30-40 in-lbs (3.4-4.5 Nm).

CAUTION
See Figure 3-117. When replacing the reed valve it is extremely important to ensure that both edges of the reed valve stop (1) and the reed valve (2) are properly aligned to prevent premature failure of the reed valve. When replacing the reed valve it is not necessary to replace the reed block. See Figure 3-116.
GENERAL

1. Oil is gravity-fed from the oil reservoir to the gerotor-style oil pump through a feed hose. Oil enters the feed section and fills a cavity located under the feed pump.

   NOTE
   See 3.13 OIL PUMP for a complete explanation of the gerotor pump sets.

2. The feed pump transfers oil from the inlet cavity through the external steel line to the oil cooler.

3. From the oil cooler oil flows to the oil filter mount.

4. Through the filter mount cavity oil flows to the oil filter.

5. Oil enters the peripheral cavity of the oil filter, passes through the filtering medium into the central cavity of the oil filter, and flows into the filter adapter (fitting which connects filter to filter mount).

6. Adequate oil pressure in the filter mount cavity activates the oil pressure signal light switch and shuts off the oil pressure signal light.

7. Oil flowing from the filter adapter opens the check ball. The check ball opens at 4-6 psi (28-41 kPa) oil pressure.

8. With the check ball open, oil flows into the crankcase feed galley.

9. Oil enters an intersecting passage in the gearcase cover and flow is then routed to the pinion bushing.

10. Oil enters a hole in the end of the pinion gear shaft and travels to the right flywheel where it is routed through the flywheel to the crankpin. Oil is forced through the crankpin to properly lubricate the rod bearing assembly.

11. Oil flow then continues through the gearcase cover to the main feed galley at the top of the gearcase cover. Drilled passages in the crankcase intersect the main feed galley and carry oil to all hydraulic lifters and piston jets.

12. Oil flows up passages in the push rods to the rocker arm shafts and bushings.

13. The valve stems are lubricated by oil supplied through drilled oil holes in the rocker arms.

14. Oil collected in the push rod areas of the cylinder heads flows down the push rod cover, through drain holes in the tappet blocks and into the gearcase. After providing lubrication to the gearcase components oil returns to the scavenge section of the oil pump through a passage located in the top of the pump. Oil is then returned to the oil tank.

15. Feed oil to the rocker area is returned to the crankcase through a passage in the head and cylinder.

16. Oil collected in the sump is splash-fed to the pistons, cylinder walls and flywheel components.

17. A pair of piston oil jets cools the bottom of the piston with a spray of oil.

18. Oil collected in the sump area returns to the scavenge section of the oil pump through a passage located in the rear section of the sump. Oil flow to the pump is accomplished by the scavenging effect of the pump and by the pressure created by the downward stroke of the pistons.

19. Return oil fills a cavity above the pump's return gears. The return gears pump oil back to the oil reservoir.
GENERAL

See Figure 3-118. The oil pump consists of two gerotor gear sets, feed and return, housed in one pump body. The feed set distributes oil to the engine, the scavenge set returns oil to the tank/frame reservoir.

A gerotor-type gear set has two parts — an inner and an outer gerotor. The inner gerotor has one less tooth than the outer gerotor. Both gerotors have fixed centers which are offset to each other.

In a gerotor gear set, oil is transferred from inlet to outlet as it is trapped between the rotating inner and outer gerotors.

Gravity-fed oil from the oil reservoir enters the pump through the feed line connector. It is forced by the gerotor feed set through a line to the oil filter. Return oil from the flywheel compartment is drawn back into the pump and is forced by the gerotor scavenge set back to the oil reservoir.

The oil pump seldom needs servicing. Before you disassemble an oil pump suspected of not producing adequate oil pressure, be sure that all possible related malfunctions have been eliminated:

1. Make sure all oil line connections are tight and that lines are not pinched or damaged.
2. Check level and condition of oil in reservoir/swingarm. Pressure will be affected if oil is diluted. In freezing weather, proper circulation of oil can be affected if the oil feed line becomes clogged with ice or sludge.
3. Check for a grounded oil pressure switch wire or faulty switch if oil indicator light fails to go out with engine running.

12. 45º Fitting
13. Sems screw (2)
14. TORX screw (2)
15. Rear connector fitting
NOTE
Oil pump can be removed with engine in frame and without removing gearcase cover.

1. Drain oil reservoir. See 1.6 ENGINE LUBRICATION SYSTEM.
2. Remove and discard oil filter.
3. See Figure 3-119. Disconnect feed line connections (1 & 6) on both sides of the oil pump.
4. Detach return line connection (3).
5. Carefully remove mounting screws (5) and washers only. Pump will drop with screws removed. Discard mounting gasket.
6. Remove cover TORX screws (2). Lift cover off body.
7. Remove and discard O-ring.
8. Slide both pieces of gerotor feed set, separator plate and both pieces of gerotor scavenge set off gear shaft.
9. Remove and discard retaining ring. Remove thrust washer and gear shaft.

Figure 3-119. Oil Pump Hardware
CLEANING AND INSPECTION

1. Clean all parts in cleaning solvent. Blow out holes and oil passages with compressed air.

2. See Figure 3-120. Inspect both gerotor sets for wear.
   a. Mesh pieces of each set together as shown.
   b. Use a feeler gauge to determine clearance.
   c. The SERVICE WEAR LIMIT between gerotors is 0.004 in. (0.102 mm). Replace gerotors as a set if clearance exceeds this dimension.
   d. Measure thickness of feed gerotors with a micrometer. Replace gerotors as a set if they are not the same thickness.

3. See Figure 3-118. Check gear shaft teeth for damage or wear. Replace if necessary.

ASSEMBLY/INSTALLATION

NOTE

Liberally coat all moving parts with clean engine oil to ensure easy assembly and smooth operation at start-up.

1. See Figure 3-118. Install gear shaft through body. Position thrust washer over end of shaft. Install new retaining ring into groove in shaft.

2. Insert inner gerotor of the gerotor scavenge set over gear shaft.

3. Place outer gerotor over inner gerotor to complete scavenge set.

4. See Figure 3-121. Install gerotor separator plate by lining up slots on perimeter with tabs inside oil pump body.

5. Install a new O-ring into groove in pump body.

6. See Figure 3-118. Place gerotor feed set over gear shaft.

7. Place cover onto pump body. Install cover TORX screws. Tighten to 70-80 in-lbs (8-9 Nm).

8. Place new mounting gasket in position.

NOTE

If fittings were removed, use TEFLON® PIPE SEALANT or HYLOMAR® on fitting threads.

9. Secure pump to crankcase with mounting screws. Tighten to 125-150 in-lbs (14-17 Nm).

10. See Figure 3-119. Attach return line connection.

11. Attach feed line connections to both sides of the oil pump.

12. Install new oil filter and fill oil reservoir with proper oil. See 1.6 ENGINE LUBRICATION SYSTEM.
GENERAL

See Figure 3-122. Oil is pressure-fed from the oil pump to the oil cooler via an external steel line. From the oil cooler, oil flows to the oil filter mount. Oil travels through the filter mount into the filter through the outer filter holes.

Adequate oil pressure activates the oil pressure indicator switch in the filter mount, which turns off the oil pressure indicator lamp.

The check ball in the filter adapter opens at 4-6 psi (28-41 kPa) oil pressure. Filtered oil leaves the filter, flowing past the check ball.

DISASSEMBLY

1. Remove chin fairing. See 2.34 CHIN FAIRING.
2. Drain oil reservoir and remove filter. See 1.6 ENGINE LUBRICATION SYSTEM.
3. See Figure 3-122. Remove filter adapter (6) from filter mount (3). Remove check ball (5) and spring (4).
4. Detach indicator lamp wire (2) from oil pressure indicator switch (1). Remove switch using OIL PRESSURE SENDING UNIT WRENCH (Part No. HD-41675).

CLEANING AND INSPECTION

WARNING

Low pressure compressed air can blow debris into your face and eyes. Always wear eye protection or a face shield when using pressurized air. Failure to take adequate safety precautions could result in death or serious injury.

Thoroughly clean all parts in cleaning solvent. Blow out holes and passages using compressed air.

ASSEMBLY

NOTE

Use TEFLOPIE SEALANT or HYLOMAR on all fittings installed to oil filter mount.

1. See Figure 3-122. Install oil pressure indicator switch (1) using OIL PRESSURE SENDING UNIT WRENCH (Part No. HD-41675). Tighten to 50-70 in-lbs (6-8 Nm).
2. Attach indicator lamp wire (2).

NOTE

The filter adapter has identical ends; either end may be installed into the filter mount.

3. Apply several drops of LOCTITE® 243 (blue) to last few threads on that end of the filter adapter which is installed into filter mount. Do not apply LOCTITE to adapter threads on filter element side.
4. Install filter mount components.
   a. Place spring (4) and check ball (5) into threaded hole at center of mount.
   b. Push threaded end of filter adapter (6) (with LOCTITE) against check ball to compress spring.
   c. Screw adapter into threaded hole. Tighten to 96-144 in-lbs (11-16 Nm).
5. Install a new filter and fill oil reservoir with proper oil. See 1.6 ENGINE LUBRICATION SYSTEM.
6. Install chin fairing. See 2.34 CHIN FAIRING.

Figure 3-122. Oil Filter Mount Assembly
GENERAL

See Figure 3-123. The lifter assembly consists of a hydraulic lifter and roller. The lifter and roller, under compression force from valve spring, follow the surface of the revolving cam. The up-and-down motion produced is transmitted to the valve by the push rod and rocker arm. The lifter contains a piston (or plunger) and cylinder; it also contains a check valve, which allows the unit to fill with engine oil, thereby reducing clearance in the valve train.

When a lifter is functioning properly, the assembly operates with minimal lifter clearance. The unit automatically compensates for heat expansion to maintain a no-clearance condition.

It is normal for lifters to click when engine is started after standing for some time. Hydraulic lifters have a definite leak-down rate which permits the oil in the lifters to escape. This is necessary to allow units to compensate for various expansion conditions of parts and still maintain correct clearance operation. Lifters are functioning properly if they become quiet after a few minutes of engine operation.

REMOVAL

1. Clean all dirt from around crankcase. Blow loose particles from area with compressed air.
2. Pull each push rod upward through top of cylinder head. See 3.6 CYLINDER HEAD.
3. Remove cylinder head assemblies. See 3.6 CYLINDER HEAD.
4. See Figure 3-125. Remove push rod covers.
   a. Remove screws.
   b. Remove push rod covers.
   c. Remove gaskets and o-rings. Discard parts.
5. Remove valve hydraulic lifters.
   a. Remove anti-rotation screws.
   b. Remove lifters from crankcase bore using a thin-bladed screwdriver. Mark the location and orientation (front/back) of each lifter.

CLEANING AND INSPECTION

WARNING
Low pressure compressed air can blow debris into your face and eyes. Always wear eye protection or a face shield when using pressurized air. Failure to take adequate safety precautions could result in death or serious injury.

   
   NOTE
   Inside and outside micrometers used for measuring tappets and tappet guides must be calibrated to ensure accurate readings.

2. Inspect valve lifters for excessive clearance in guide. Accurately measure lifter bore inner diameter with a gauge.
   a. Clearance should be within 0.0008-0.0020 in. (0.0203-0.0508 mm).
   b. Fit a new lifter and/or replace crankcases if clearance exceeds SERVICE WEAR LIMIT of 0.0030 in. (0.076 mm).
3. Check lifter roller freeplay.
   a. Roller clearance on pin should be within 0.0006-0.0010 in. (0.0152-0.0254 mm).
   b. Replace lifters if clearance exceeds SERVICE WEAR LIMIT of 0.0015 in. (0.0381 mm).
4. Check lifter roller end clearance.
   a. End clearance should be within 0.008-0.022 in. (0.203-0.559 mm).
   b. Replace lifters if clearance exceeds SERVICE WEAR LIMIT of 0.026 in. (0.660 mm).
1. See Figure 3-124. Rotate engine so that both lifters from the cylinder will be installed on the base circle of the cam.

2. Apply a liberal amount of engine oil to each lifter assembly (especially the roller needles) for smooth initial operation.

3. See Figure 3-125. Insert lifter into bore in crankcase. Rotate lifter so that flats at upper end of lifter face the front and rear of the engine. If the lifter is installed incorrectly, anti-rotation screws cannot be inserted.

4. Secure lifters in place.
   a. Install anti-rotation screws with washers in the holes in lifter block.
   b. Tighten anti-rotation screws to 55-65 in-lbs (6-7 Nm).

5. See Figure 3-125. Install push rod cover.
   a. Place new push rod cover gasket over bottom of push rod cover.
   b. Position push rod cover onto crankcase.
   c. Install screws through holes in push rod cover into tapped holes in crankcase. Tighten screws evenly to 30-40 in-lbs (3-5 Nm).
   d. Place new o-rings on top of push rod cover.

6. Install push rods, cylinder head, lower and upper rocker covers. See 3.6 CYLINDER HEAD.

7. Repeat process for remaining cylinder head.
GENERAL

Read the complete gearcase section carefully before you begin any service work.

For the gearcase components to operate at their optimum, all components must be properly fitted and matched. Changing one component can affect many others. It is important to know and understand all inspection procedures and how components interact.

Figure 3-126. Gearcase Cover & Cam Assembly

16. bushing, gear shaft- pinion
**WARNING**

Low pressure compressed air can blow debris into your face and eyes. Always wear eye protection or a face shield when using pressurized air. Failure to take adequate safety precautions could result in death or serious injury.

1. See Figure 3-126. Thoroughly clean area around gearcase cover and tappets. Blow loose dirt from crankcase with compressed air.

2. Remove any parts that will interfere with gearcase disassembly.

3. Remove push rods. See 3.6 CYLINDER HEAD.

4. Remove hydraulic lifters. See 3.15 HYDRAULIC LIFTERS.

5. Check for minimum cam gear end play. Record readings.

6. Remove cam position sensor and rotor from gearcase cover. See 4.30 CAM POSITION SENSOR AND ROTOR.

7. Place a pan under gearcase to collect oil. Remove cover screws. Carefully remove gearcase cover. Discard old gasket.

   **NOTE**
   If cover does not come loose on removal of screws, tap lightly with a plastic hammer. Never pry cover off.

8. See Figure 3-127. Remove cam gears (1, 2, 3 & 4).

   **NOTE**
   Nut is secured by LOCTITE 262 (red) on the nut threads.

9. Remove pinion nut (6). Slide pinion gear (5) and oil pump drive gear (6) off pinion shaft.

   **NOTE**
   See Figure 3-127. The XB9S uses new style timing marks on the front intake cam assembly (2). Please note the “V” markings.

---

**Figure 3-127. Cam and Pinion Gear Location and Timing Mark Indexing**

1. Front exhaust cam gear
2. Front intake cam gear
3. Rear intake cam gear
4. Rear exhaust cam gear
5. Pinion gear
6. Pinion nut
CLEANING AND INSPECTION

1. Thoroughly clean gearcase compartment, gearcase cover and gears in solvent to remove oil and carbon deposits.

**WARNING**
Low pressure compressed air can blow debris into your face and eyes. Always wear eye protection or a face shield when using pressurized air. Failure to take adequate safety precautions could result in death or serious injury.

2. Blow out all cover oil passages and bushings with compressed air.

3. Clean old gasket material from gearcase and crankcase.

**Cam and Pinion Gear Identification, Inspection and Selection**

See Figure 3-128. Cam lobes are stamped with a number (1, 2, 3 or 4) followed by a letter (“E”). The numbers identify the cam location/function and the letter (“E”) indicates model year application:

**Table 3-26. Cam Identification**

<table>
<thead>
<tr>
<th>Stamp</th>
<th>Location/Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>1E</td>
<td>Front Exhaust</td>

<td>0.003</td>
</tr>
<tr>
<td>Pinion</td>
<td>0.0023-0.0043</td>
<td>0.0050</td>
</tr>
</tbody>
</table>

**NOTE**
If Service Wear Limits are exceeded, replace crankcase set and/or gearcase cover as required.
1. See Figure 3-129. Install oil pump drive gear and pinion gear on pinion shaft.
   a. Install shaft key into pinion shaft slot.
   b. Slide oil pump drive gear over pinion shaft. Drive gear must align with shaft key.
   c. Align keyway in ID of pinion gear with shaft key.
   d. Slide pinion gear over shaft key and against oil pump drive gear.

2. See Figure 3-126. Install pinion nut.
   a. Clean threads on pinion shaft and nut.
   b. See Figure 3-130. Install CRANKSHAFT LOCKING TOOL (Part No. HD-43984) to gearcase with "Side B" facing out, over pinion shaft, with two screws.
   c. Apply several drops of LOCTITE 262 (red) to last few threads of nut.
   d. Install nut to pinion shaft. Tighten nut to 19-21 ft-lbs (26-29 Nm) plus an additional 15° to 19° rotation.

3. See Figure 3-126. Liberally apply engine oil to bushings, shafts, and gears. Install all cam gears into bushings of right crankcase half, properly aligning timing marks of cam gears and pinion gear.

   NOTES
   ● The XB9S uses new style timing marks on the front intake cam assembly. Please note the "V" design.
   ● Because of the larger diameter additional gear (which meshes with the pinion gear) on the outboard end of the cam, the front exhaust cam gear and the rear intake cam gear must be installed before the front intake cam gear is installed.

4. See Figure 3-126. Install a new seal and new dry gear cover gasket on crankcase.

Figure 3-129. Aligning Pinion Gear

Figure 3-130. Crankshaft Locking Tool (Part No. HD-43984)
5. See Figure 3-131. Install gearcase cover over all gears and onto right crankcase half. Secure cover to crankcase half with 7 socket head screws. Tighten screws evenly to 80-110 in-lbs (9-12 Nm). Use torque sequence as shown in Figure 3-131.

6. See Figure 3-132. Check cam gear end play for each cam gear as follows:
   a. Turn engine over until lobe of cam gear being checked is pointing toward its respective tappet guide hole.
   b. Gently pry the cam gear toward the gearcase cover using a flat blade screwdriver.
   c. Measure gap between bushing (in crankcase half) and cam gear shaft thrust face (shoulder) using a feeler gauge. This is cam gear end play.
   d. Compare cam gear end play measurements with the SERVICE WEAR LIMITS. Make repairs as required if end play does not meet specifications.

7. Install hydraulic lifters and push rods. See 3.15 HYDRAULIC LIFTERS.

8. Install cam position sensor and rotor in gearcase cover. See CAM POSITION SENSOR AND ROTOR section.

9. Install any components removed to gain access to gearcase (i.e. exhaust system components, air cleaner, etc.).
GENERAL

When rod bearings, pinion shaft bearing, or sprocket shaft bearing are in need of repair, the engine must be removed from the chassis; see 3.4 STRIPPING MOTORCYCLE FOR ENGINE SERVICE in this section. It is recommended procedure to check and make repairs to cylinder heads, cylinders, gear case and transmission at the same time (perform entire engine overhaul).

CAUTION

Laying engine on primary side will damage clutch cable end fitting. If fitting is damaged, clutch cable must be replaced.

DISASSEMBLY

Crankcase Halves

1. Remove cylinder heads. See 3.6 CYLINDER HEAD.

CAUTION

After removing cylinders, install plastic or rubber hose over cylinder studs. Lifting or moving crankcase by grasping studs will cause cylinder stud damage.

2. Remove cylinders and pistons. See 3.7 CYLINDER AND PISTON.

3. Remove oil pump. See 3.13 OIL PUMP.

4. Remove gearcase components. See 3.16 GEARCASE COVER AND CAM GEARS.

5. Remove primary cover and primary drive/clutch components. See 6.2 PRIMARY CHAIN.

6. Remove starter motor. See 5.7 STARTER.

7. See Figure 3-133. Remove rear isolator assembly by removing the forward two fasteners first and then the two rear fasteners (re-install with new fasteners).

8. See Figure 3-134. Remove screws securing crankcase halves together.

9. Tap crankcase with plastic mallet to loosen and separate the halves.
PISTON JETS

Removal

1. See Figure 3-135. Remove two TORX screws from each piston jet assembly to free piston jets from right crankcase.
2. Remove piston jet gaskets from right crankcase.

Installation

**CAUTION**

Gaskets that are missing, distorted, pinched or otherwise damaged will result in either oil leakage or low oil pressure.

**NOTE**

Gasket is part of the piston jet assembly. Gasket not sold separately.

1. Install new piston oil jet assemblies in right crankcase.
2. Apply Loctite Low Strength Threadlocker 222 (purple) to threads of TORX screws.
3. With the jet pointed upward, install TORX screws to secure piston jet to crankcase. Tighten screws to 25-35 in-lbs (2.8-4.0 Nm).
Flywheel Assembly

1. See Figure 3-136. Remove the flywheel assembly from left crankcase half.

   **NOTE**
   Flywheel assembly slides out of the left main bearing by hand. No tools are required for this operation.

   **NOTE**
   See Figure 3-137. If it is necessary to remove either the pinion shaft bearing or sprocket shaft bearing, proceed as follows:

2. See Figure 3-137. Gear shaft bearing (11) will remain on flywheel pinion shaft. Remove retaining ring (12) and bearing can be slipped off pinion shaft.

---

**Figure 3-136. Removing Flywheels from Left Crankcase**

**Figure 3-137. Crankcase and Flywheel Assembly**

1. Spacer, sprocket shaft
2. Retaining ring, oil seal
3. Oil seal
4. Thrust washer
5. Crankcase half
6. Bearing
7. Bearing retaining ring
8. Inner race, left main bearing
9. Thrust washer
10. Connecting rod and flywheel assembly
11. Inner race
12. Gear shaft bearing
13. Retaining ring
14. Outer bearing race
15. Crankshaft case
3. See Figure 3-138. Place flywheel assembly in FLYWHEEL SUPPORT FIXTURE (Part No. HD-44385). Pull sprocket shaft bearing inner race with WEDGE ATTACHMENT for CLAW PULLER (Part No. HD-95637-46A) with BEARING RACE REMOVER/INSTALLER (Part No. HD-34902B) and END CAP (Part No. HD-34902-7).

**NOTE**
Left main bearing inner race does not need to be ground once it is installed on the sprocket shaft.

4. See Figure 3-139. Remove left main oil seal retaining ring.

5. See Figure 3-137. Remove left main oil seal (2) from crankcase using Snap-On Tool (Part No. CJ 114, Body Dent Puller)

6. Remove outer thrust washer (4) next to left main bearing (6).

7. See Figure 3-140. Remove left main bearing retaining ring from the inside of the left crankcase half.

8. See Figure 3-141. Using CRANKCASE BEARING REMOVER/INSTALLER (Part No. B-45655 and HD-42720-2) press left main bearing out of the left crankcase half.

**NOTE**
The bearing presses to the inside. There is a shoulder incorporated into the left crankcase half which allows the bearing to be removed in one direction only.
Fitting Pinion Bearings

See Figure 3-137. A pressed-in bushing in the right crankcase half is the outer race (14). The inner race (11) is pressed onto the pinion shaft.

1. See Figure 3-142. To remove pinion shaft inner race, use WEDGE ATTACHMENT for CLAW PULLER (Part No. HD-95637-46A) with BEARING RACE REMOVER/INSTALLER (Part No. HD-34902B) and END CAP (Part No. HD-34902-7). Apply heat to race to aid removal.

Figure 3-142. Removing Pinion Bearing Inner Race

1. Bearing race remover/installer (Part No. HD-34902B)
2. End cap (Part No. HD-34902-7)
3. Wedge attachment for claw puller (Part No. HD-95637-46A)

NOTE
Pinion bearing selection at the factory, during engine build, or replacement of crankcase set or flywheel assembly is based on the largest measured outside diameter (OD) of the inner race and the smallest measured inside diameter (ID) of the outer race (crankcase bushing). A running clearance of 0.0002-0.0008 in. (0.0051-0.0203 mm) is established during crankcase set or flywheel assembly replacement and engine rebuild.

</tbody>
</table>

**FACTORY COLOR CODE**

Green White
If either inner or outer race show wear, measure both races to confirm correct bearing fit.

1. Use a dial bore gauge to measure and record ID of outer race. Take four measurements on ID where bearing rollers ride.
   a. If the largest measurement is larger than 1.5672 in. (39.8069 mm) or the required lapping to remove wear marks would enlarge bore beyond 1.5672 in., continue at Step 5.
   b. If largest measurement is 1.5672 in. (39.8069 mm) or less, cover the cam bearings with masking tape to prevent debris from entering bearings. Assemble crankcase halves.

NOTE
The next step requires lapping the outer race. To keep sprocket shaft and pinion shaft bearings aligned the lap must be supported by an adapter or pilot in the left crankcase half.

2. See LAPPING ENGINE RIGHT MAIN BEARING RACE. Lap race until all wear marks are removed.
3. Measure and record ID of race at four places.
4. Check measurements against the specifications listed in Table 3-32.

5. Press the outer race from the right crankcase. Press new outer race into crankcase flush with inside edge of cast-in insert.

NOTE
See Figure 3-146. Dimensions are shown for fabrication of tools used in pressing the outer race into or out of crankcase.

Table 3-32. Outer Pinion Race Service Wear Limits

<table>
<thead>
<tr>
<th>Largest ID measured</th>
<th>1.5672 in. (39.8069 mm) or less</th>
</tr>
</thead>
<tbody>
<tr>

<td>within 0.0002 in. (0.0051 mm)</td>
</tr>
<tr>
<td>Taper</td>
<td>within 0.0002 in. (0.0051 mm)</td>
</tr>
</tbody>
</table>

   a. If lapping increased bore ID to larger than 1.5672 in. (39.8069 mm), go to Step 5.
   b. If roundness or taper do not meet specifications, continue lapping until specifications are met.
   c. If all specifications are met, continue at Step 7 to remove and size inner race.

6. The new outer race must be lapped slightly to true and align with left case bearing and to meet the following specifications in Table 3-33. See LAPPING ENGINE RIGHT MAIN BEARING RACE.

Table 3-33. New Component Specifications

</tbody>
</table>
7. See Figure 3-142. Pull inner race from pinion shaft using WEDGE ATTACHMENT for CLAW PULLER (Part No. HD-95637-46A) with BEARING RACE REMOVER/INSTALLER (Part No. HD-34902B) and END CAP (Part No. HD-34902-7). Apply heat to race to aid removal.

NOTE
For necessary dimensions for constructing a press-on tool for the pinion bearing inner race see Figure 3-146.

8. See Figure 3-147. Press new inner race on pinion shaft as shown. When the tool bottoms against the flywheel, correct inner race location is automatically established. The new inner race must be ground by a competent machinist to OD dimension range for the finished lapped ID of the outer race. See Table 3-31. The finished inner race must meet the specifications in Table 3-34.

9. The following example illustrates how to determine the required inner race OD.
   a. See Table 3-31. For example purposes, suppose the smallest outer race ID measurement is 1.5651 in. (39.754 mm). This requires an inner race OD range of 1.2496-1.2504 in. (31.740-31.760 mm).
   b. Grind inner race. Measure OD at four places. Check that specifications in Step 8 are met.
   c. For example purposes, suppose the largest inner race OD measurement after grinding is 1.2499 in. (31.747 mm) OD.
   d. With a 1.5651 in. (39.754 mm) ID outer race and a 1.2499 in. (31.747 mm) OD inner race, a blue bearing is required.

Table 3-34. Pinion Inner Race Fitment Specifications

</tr>
<tr>
<td>Surface finish</td>
<td>16 RMS</td>
</tr>
</tbody>
</table>

NOTES
- Have machinist grind inner race to center or middle of required OD range in Table 3-31. This will prevent grinding outer race undersize and gives a more easily achieved tolerance range.
- If you are unable to perform this operation, Harley-Davidson Motor Company provides a flywheel refurbishing program as outlined in Tech Tip #38.
- Always use the smallest outer race ID measurement and the largest OD inner race measurement when selecting bearings.
Lapping Engine Right Main Bearing Race

1. Secure right and left crankcase halves with three crankcase stud bolts (top center and bottom left and right). The sprocket shaft bearing outer races and large spacer must be installed in left crankcase.

2. See Figure 3-148. Obtain CRANKCASE MAIN BEARING LAPPING TOOL (Part No. HD-96710-40B). Assemble CRANKCASE MAIN BEARING LAP (Part No. HD-96718-87) to lapping handle. Assemble guide sleeve to sprocket shaft bearing bushing. Sleeves, for use with tapered bearing, are assembled to case with bearings and small spacer collar. Finger-tighten the sleeve parts.

3. Insert lap shaft with arbor assembled through pinion bearing bushing and into guide sleeve. Tighten arbor expansion collars using a length of 0.156 in. (3.962 mm) rod as spanner until arbor begins to drag. Do not adjust arbor snug in bushing or bushing will develop a condition where hole is larger at ends than it is in the center.

4. Withdraw arbor far enough to coat lightly with 220 grit lapping compound. Do not apply a heavy coat. Reposition lap in bushing and turn handle at moderate hand speed. Work lap back and forth in bushing, as it is revolved, to avoid grooving and tapering.

At frequent intervals, remove lap from crankcase, wash and inspect bushing. Lapping is completed when entire bushing surface has a dull, satin finish rather than a glossy, smooth appearance. If necessary, flush off lap in cleaning solvent, air dry and apply fresh, light coat of fine lapping compound.

Checking Connecting Rod Side Play

1. See Figure 3-149. Check connecting rod side play with a thickness gauge as shown.

2. If side play measurement is greater than 0.036 in. (0.8 mm), replace flywheel/connecting rod assembly.
Crankcase Halves

NOTE
Lubricate all parts with Harley-Davidson 20W50 engine oil, and proceed as follows:

Figure 3-150. Left Main Bearing Assembly

1. Spacer, sprocket shaft
2. Retaining ring, oil seal
3. Oil seal
4. Thrust washer
5. Crankcase half
6. Bearing
7. Bearing retaining ring
1. See Figure 3-151. Using CRANKCASE BEARING REMOVER/INSTALLER (Part No. B-45655 and HD-42720-2), install left main bearing into left crankcase half from the inside.

   **NOTE**
   
   Make sure that the bearing assembly bottoms against the machined shoulder in the left crankcase half.

2. Install new bearing retaining ring in left crankcase half.

3. Install transmission. See 6.13 TRANSMISSION INSTALLATION.
7. See Figure 3-154. Assemble crankcase halves together.
   a. Apply a thin coat of DOW CORNING SILASTIC #732 CLEAR sealant to crankcase joint faces.
   b. Slide outer race in right crankcase over pinion shaft and bearing assembly.
   c. Tighten fasteners to 15-19 ft-lbs (20-26 Nm).

   **NOTE**

   According to manufacturing, there is no torque sequence to follow when tightening crankcase fasteners.
8. See Figure 3-150. Install thrust washer (4) from the outside against the left main bearing.
9. Install **new** spacer (1) in seal ID. With the thin (lipped) side facing outward, center seal/spacer assembly over bearing bore.

**CAUTION**

Do not remove the spacer after installation or the new seal will have to be discarded and the procedure repeated.

10. See Figure 3-155. Use SPROCKET SHAFT SEAL INSTALLER (Part No. B-45676) to install sprocket shaft seal.
   
   a. Center seal/spacer driver over seal, so that the sleeve (smaller OD) seats between seal wall and garter spring.
   
   b. Sparingly apply graphite lubricant to threads of pilot shaft to ensure smooth operation.
   
   c. Slide sleeve over pilot until sleeve contacts the oil seal. Install handle on top of sleeve.
   
   d. Rotate handle clockwise until tool bottoms on crankcase lip. Remove tool from sprocket shaft.
   
   e. Install **new** retaining ring in groove in left crankcase next to oil seal.

11. See Figure 3-156. Install cylinder studs.
   
   a. Pack clean towels into crankcase opening.
   
   b. Place a steel ball into a head screw.
   
   c. The cylinder studs have a shoulder at the lower end. Place the end of the stud without the shoulder into the head screw.
   
   d. Install the stud in the crankcase with the shoulder end down. Use an air gun to drive the stud until the shoulder reaches the crankcase.
   
   e. Remove air gun. Use a torque wrench to tighten stud to 10-20 ft-lbs (14-27 Nm).

12. Install piston and cylinder. See **3.7 CYLINDER AND PISTON**.

13. Install oil pump. See **3.13 OIL PUMP**.

14. Install cam gears, gearcase cover, lifter guides and lifters. See **3.16 GEARCASE COVER AND CAM GEARS**.

15. Install cylinder head. See **3.6 CYLINDER HEAD**.

16. Install starter. See **5.7 STARTER**.

17. Install shift linkage.

18. Install all primary drive components. This includes engine sprocket, primary chain, complete clutch assembly, engine sprocket nut and mainshaft nut. See **6.4 PRIMARY DRIVE/CLUTCH**.

19. Install primary cover. See **6.2 PRIMARY CHAIN**.

**NOTE**

Be sure to refill transmission to proper level with fresh lubricant. See **1.11 PRIMARY CHAIN**.

20. See **3.6 CYLINDER HEAD** and perform the applicable steps.

21. To reinstall engine in frame see **3.5 ENGINE INSTALLATION**.

INTRODUCTION

The Buell Dynamic Digital Fuel Injection (DDFI) System provides microprocessor-based electronic engine management for the 984cc high performance engine. The DDFI system has the following features:

- Independently mapped spark and fuel control.
- Engine and air temperature compensated fuel delivery.
- Engine load measurement through throttle position.
- Single point spark delivery (no waste spark).
- Sequential port indirect (manifold) fuel injection.
- Open/Closed-loop air/fuel control.
- Automatic enrichment at start-up.
- Electric cooling fan for improved thermal management.
- Engine speed and position determined using a single sensor (Cam Position Sensor).
- Full diagnostic capability compatible with the DIGITAL TECHNICIAN (Part No. HD-44750).
- Returnless fuel system (excess pressure relieved in tank by Fuel Pressure Regulator Valve).

The DDFI system uses six sensors to monitor the operating conditions of the engine and make decisions as to spark and fuel delivery. These sensors are:

- Throttle position (TP) sensor.
- Cam position (CMP) sensor.
- Engine temperature (ET) sensor.
- Intake air temperature (IAT) sensor.
- Oxygen (O2) sensor.
- Bank Angle Sensor (BAS).

The DDFI system also analyzes how the engine performs during a ride. It then stores this information internally so it will be available for the next ride.

GENERAL

The Buell DDFI operates both as an open and closed loop system which allows it to adjust for all possible operating conditions. During open loop operation, the system utilizes programmed fuel and spark maps in the ECM which provide ease of cold starting and maximum power at wide open throttle (WOT). The adaptive fuel value which is “learned” during closed loop operation is applied during open loop operation to adjust fuel and spark maps for optimum performance.

During closed loop operation, the system relies on input from the O2 sensor to provide for the most efficient, stoichiometric air fuel mixture (14.7:1) which results in reduced emissions, good fuel economy and power. In order for the system to enter closed loop operation, the following conditions must be met:

- O2 Sensor at operating temperature (Engine at normal operating temperature).
- Operation between 1200 and 5000 RPM with light to moderate throttle.
- System is also in closed loop at idle.

By using both open and closed loop systems, engine performance is continuously tuned to compensate for changing conditions and provide maximum performance.

FOR MORE INFORMATION

To learn more about the Buell DDFI system, read the following topics in this section. A system diagram can be found on the next page in Figure 4-1.

Troubleshooting

- 4.3 DIAGNOSTIC INTRODUCTION.
- 4.4 CHECKING FOR TROUBLE CODES.
- 4.5 CHECK ENGINE LAMP DIAGNOSTICS.
- 4.8 INITIAL DIAGNOSTIC CHECK.

- one 12-place gray connector [11]
SYSTEM PROBLEMS

All system problems fall into at least one of three general categories.

No Start

The engine cranks over freely, but will not start. This does not include situations where the engine will not crank, such as a bad starter, dead battery, etc. This condition assumes that all obvious checks (fuel in tank, etc.) have been made.

Poor Performance

The engine starts but there are performance problems. These problems may include poor fuel economy, rough idle, engine misfire, engine hesitation, severe spark knock, etc.

Check Engine Lamp

See Figure 4-2. The check engine lamp indicates a fault condition exists. There may also be starting or performance problems.

RESOLVING PROBLEMS

NOTE

The most sophisticated method of resolving problems involves using a computer based diagnostic package called DIGITAL TECHNICIAN (Part No. HD-44750).

To resolve system problems, five basic steps are involved. In order of occurrence, they are:

1. Check for trouble codes by observing check engine lamp. See 4.4 CHECKING FOR TROUBLE CODES.
2. Retrieve trouble codes using check engine lamp diagnostics. See 4.5 CHECK ENGINE LAMP DIAGNOSTICS.
3. Diagnose system problems. This involves using special tools and the diagnostic flow charts in this section.
4. Correct problems through the replacement and/or repair of the affected components.
5. After repairs are performed, the work must be validated. This involves clearing the trouble codes and confirming proper vehicle operation as indicated by the behavior of the check engine lamp.
CHECK ENGINE LAMP

To diagnose system problems, start by observing the behavior of the check engine lamp.

**NOTE**
- All references to “Key ON” or “Ignition Switch ON” require that the ignition key be in the ON position and the engine stop switch be set to RUN.

- If the check engine lamp is not illuminated at Key ON or if it fails to turn OFF after the initial four second period, then a problem exists in the lamp circuit. See 4.9 CHECK ENGINE LAMP NOT ILLUMINATED AT KEY ON or 4.10 CHECK ENGINE LAMP ON CONTINUOUSLY for more information.

1. When the ignition switch is turned ON after being OFF for 2 seconds or more, the check engine lamp will illuminate for approximately four seconds and then turn off.

2. See Figure 4-5. After lamp turns off after being illuminated for the first four second period, one of three situations may occur.
   a. The lamp remains off. This indicates there are no current fault conditions or stored functional trouble codes currently detected by the ECM.
   b. The lamp stays off for only four seconds and then comes back on for an eight second period. This indicates a functional error code is stored, but no current trouble code exists.
   c. If the lamp remains on beyond the eight second period, then a current trouble code exists.

3. See CODE TYPES for a complete description of trouble code formats.
CODE TYPES

There are two types of trouble codes: current and historic. Certain codes are also called functional codes. Historic codes can be read using the check engine lamp diagnostics.

All trouble codes reside in the memory of the ECM until the code is cleared by DIGITAL TECHNICIAN (Part No. HD-44750) or a total of 50 trips has elapsed. A trip consists of a start and run cycle, the run cycle lasting at least 30 seconds. After the 50 trip retention period, the trouble code is automatically erased from memory providing that no subsequent faults of the same type are detected in that period.

NOTE

Trouble codes relating to the fuel injectors or the ignition coil can only be fully diagnosed during actuation. For example, a problem with the ignition coil will be considered a current fault even after the problem is corrected, since the ECM will not know of its resolution until after the coil is activated by vehicle start sequence. In this manner, there may sometimes be a false indication of the current trouble code.

Current

Current trouble codes are those which presently disrupt motorcycle operation. See the appropriate flow charts for solutions.

Historic

If a particular problem happens to resolve itself, the active status problem is dropped and it becomes a historic fault rather current fault.

Historic trouble codes are stored for a length of time to assist in the diagnosis of intermittent faults. The check engine lamp will not turn on during normal operation if only historic codes are present.

It is important to note that historic trouble codes may also be present whenever the system indicates the existence of a current fault. See 4.4 CHECKING FOR TROUBLE CODES if multiple trouble codes are found.

Functional

Trouble codes 52 through 56 are considered to be functional codes. They indicate an internal problem with the ECM (trouble codes 52 through 55) or with the camshaft sensor/timing (trouble code 56).

RETRIEVING TROUBLE CODES

The fuel injection system provides two levels of diagnostics.

- The most sophisticated mode employs using a computer based diagnostic package called DIGITAL TECHNICIAN (Part No. HD-44750).
- The other mode requires using the check engine lamp. See 4.5 CHECK ENGINE LAMP DIAGNOSTICS for more information.

MULTIPLE TROUBLE CODES

The throttle position, cam position and bank angle sensors are all connected to the same reference line (5v REF). If this line goes to ground or open, multiple trouble codes (codes 11 and 56) may be set.

Also, the ECM, fuel pump, fuel injectors and ignition coil all receive +12 volts from the ignition relay. If this line should go to ground the ignition fuse will open.

Always start with the trouble code having the lowest numerical value. Refer to Table 4-7.

CHECK ENGINE LAMP BLINKS

In addition to alerting the rider to trouble codes, the check engine lamp will blink during operation to warn of potentially damaging engine operating temperatures. If the key is in the on position and the check engine lamp is blinking, the engine is at a potentially damaging temperature. While this condition is in effect, the ECM will reduce engine power to assist in cooling the engine down to a safe operating temperature. The check engine lamp will blink until the engine has cooled to a safe operating temperature. This will not set a trouble code.
RETRIEVING TROUBLE CODES

Trouble codes may be retrieved without the use of the DIGITAL TECHNICIAN (Part No. HD-44750).

1. Remove protective cover from data link connector [91A]. Data link connector is located next to the fuse box under the seat.

2. To activate the diagnostic feature of the check engine lamp, proceed as follows:
   a. See Figure 4-6. Create diagnostic test wire from parts shown.
   b. See Figure 4-7. Install diagnostic test wire across Terminal 1 and Terminal 2 on the data link connector [91A].
   c. Turn the ignition/light key switch ON and wait approximately eight seconds for the check engine lamp to start flashing.

3. See Figure 4-8. All trouble codes are sent out as a series of flashes. To retrieve the first digit of the trouble code simply observe the number of times the lamp flashes.
   a. The transmission of a trouble code is always preceded by six rapid flashes (about 3 per second).
   b. This “intermission” is followed by a 2 second pause in which the lamp is off.
   c. The lamp will then flash one or more times to indicate the first digit of the trouble code. The length of time the lamp is illuminated and the length of time in which it is off are each about 1 second in duration.

4. The second digit follows:
   a. Following transmission of the first digit, there is another 2 second pause in which the lamp is off.
   b. The lamp will then flash one or more times to indicate the second digit of the trouble code. Count the number of times the lamp flashes to retrieve the second digit.

5. If more than one trouble code is sent:
   a. Following transmission of the second digit of the first code, there is a third 2 second pause in which the lamp is off.
   b. After the pause comes the intermission, which is followed by transmission of the next recorded trouble code.
   c. All subsequent codes are sent in the same manner, each separated from the next by the intermission.

6. Once all codes have been sent, the data string is repeated. When you have recorded the same trouble code twice, it is an indication that the transmission has been restarted and that all trouble codes have been retrieved.
7. When examining trouble codes, write down all codes on a piece of paper.
   a. If trouble codes are present, see Table 4-7. Follow the applicable flow charts for each code.
   b. If trouble codes are NOT present, but starting or driveability problems are evident, see charts under 4.8 INITIAL DIAGNOSTIC CHECK.

8. Turn the ignition/light key switch OFF.

9. Remove diagnostic test wire and install protective cover over data link connector. Return data link to original position.

NOTE
Looking at the above transmission, we can see that the trouble code is 13. The source of the fault condition is identified as the oxygen sensor according to Table 4-7.

Figure 4-8. Check Engine Lamp Diagnostics

IMPORTANT NOTE
The engine may be started and run when the trouble codes are received using a jumper wire on Pins 1 and 2 of the data link connector. However, if the jumper wire is removed with the engine running, the check engine lamp will continue to flash trouble codes. To stop check engine lamp from flashing codes, turn engine stop switch OFF.

CLEARING CODES

After correcting system problems, clear trouble codes. If the Digital Technician (Part No. HD-44750) is not available, perform 50 start and run cycles. To execute one run cycle:

1. Start the vehicle.
2. Let it run for at least 30 seconds.
3. Turn the engine off.
GENERAL

The BREAKOUT BOX (Part No. HD-42682) splices into the main harness. Used in conjunction with a DVOM, it allows circuit diagnosis of wiring harness and connections without having to probe with sharp objects.

INSTALLATION

1. See 4.29 ELECTRONIC CONTROL MODULE.
2. Depress latches on each side of connectors [10] (black) and [11] (gray) and detach connectors from the ECM.
3. See Figure 4-9. Attach Breakout Box (2) to black connector [10].
   a. Attach black connector from Breakout Box to corresponding black ECM connector.
   b. Attach black connector from the wiring harness to black connector on Breakout Box.
   a. Attach gray connector from Breakout Box to corresponding gray ECM connector.
   b. Attach gray connector from the wiring harness to gray connector on Breakout Box.

REMOVAL

1. See Figure 4-9. Depress latches on each side of connectors [10] (black) and [11] (gray).
2. Detach Breakout Box connectors from ECM connectors.
3. Detach Breakout Box connectors from wiring harness.
4. Reconnect harness to ECM. See 4.29 ELECTRONIC CONTROL MODULE.

Figure 4-9. ECM and Breakout Box with Connections

1. Breakout box
2. Breakout box grey and black connections at main harness
3. Breakout box grey and black connections at ECM
4. ECM
GENERAL

NOTE
DIGITAL TECHNICIAN (Part No. HD-44750) can be used to perform wiggle test.
The wiggle test checks for the presence of intermittents in a wiring harness.

PROCEDURE

1. See Figure 4-10. Connect DVOM (Part No. H-D-39978) to wiring harness between the suspect connections. When diagnosing ECM connections, a BREAKOUT BOX (Part No. HD-42682) may be used to simplify the procedure. See 4.6 BREAKOUT BOX.

2. Set DVOM to read voltage changes.

3. Start motorcycle engine and run at idle.

4. Shake or wiggle harness to detect intermittents. If intermittents are present, radical voltage changes will register on the DVOM.
GENERAL

To locate faulty circuits or other system problems, follow the diagnostic flow charts in this section. For a systematic approach, always begin with INITIAL DIAGNOSTICS. Read the general information and then work your way through the flow chart box by box.

Diagnostic Notes

If a numbered circle appears adjacent to a flow chart box, then more information is offered in the diagnostic notes. Many diagnostic notes contain supplemental information, descriptions of various diagnostic tools or references to other parts of the manual where information on the location and removal of components may be obtained.

Circuit Diagram/Wire Harness Connector Table

When working through a flow chart, refer to the illustrations, the associated circuit diagram and the wire harness connector table as necessary. The wire harness connector table for each circuit diagram identifies the connector number, description, type and general location.

In order to perform most diagnostic routines, a Breakout Box and a DVOM are required. See 4.6 BREAKOUT BOX.

To perform the circuit checks with any degree of efficiency, a familiarity with the various wire connectors is also necessary.

Job/Time Code Values

Dealership technicians filing out warranty claims should use the job/time code values in Digital Technician or use the ones printed in **bold text** underneath the appropriate repair in the service manual.

INITIAL DIAGNOSTICS

General Information

The diagnostic check is an organized approach to identifying a problem caused by an electronic control system malfunction.

**IMPORTANT NOTE**
The engine may be started and run when the trouble codes are received using a jumper wire on Pins 1 and 2 of the data link connector. However, if the jumper wire is removed with the engine running, the check engine lamp will continue to flash trouble codes. To stop check engine lamp from flashing codes, turn engine stop switch OFF.

Diagnostic Notes

The reference numbers below correlate with the circled numbers on the diagnostic check flow charts. See Diagnostic Check (Part 1 of 2).

1. Compare engine behavior to tables.
   a. Starts hard. See Table 4-4.
   b. Hesitates, stumbles, surges, misfires and/or sluggish performance. See Table 4-5.
   c. Engine exhaust emits black smoke or fouls plugs. See Table 4-6.

2. Use HARNESS CONNECTOR TEST KIT (Part No. HD-41404), black socket probes and patch cord.
3. Connect BREAKOUT BOX (Part No. HD-42682) to ECM. See 4.6 BREAKOUT BOX.

All diagnostic codes are listed in Table 4-7.

Diagnostic Check (Part 1 of 2)

Turn ignition/headlight key switch ON. Set engine stop switch to RUN. Do not start engine. Does check engine lamp illuminate?

YES

Does light go off after four seconds?

YES

Does engine start?

YES

See 4.4 CHECKING FOR TROUBLE CODES.

NO

See 4.10 CHECK ENGINE LAMP ON CONTINUOUSLY.

NO

See 4.11 ENGINE CRANKS BUT WILL NOT START.

YES

Are any trouble codes displayed?

YES

Refer to applicable trouble code flow chart. Start with lowest trouble code. All diagnostic codes are listed on page 4-13 in Table 4-7.

NO

Refer to diagnostic tips in related trouble code chart (even if no code is set).

STOP

Go to Diagnostic Check (Part 2 of 2).
Continued from Diagnostic Check (Part 1 of 2).

Remove ECM connectors [10B] (BK) and [11B] (GY). Check for continuity to ground at data link connector [91A] Terminals 1, 3 and 4. Continuity to ground?

**YES**

Test the four data link connector terminals against their ECM connector pins for continuity.

<table>
<thead>
<tr>
<th>DATA LINK TERMINAL</th>
<th>ECM TERMINAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pin</td>
<td>Wire Color</td>

<td>V/R</td>
</tr>
<tr>
<td>4</td>
<td>GY</td>
</tr>
</tbody>
</table>

Continuity present in all four circumstances?

**YES**

Replace ECM. See 4.29 ELECTRONIC CONTROL MODULE.

**NO**

Inspect terminals for damage or repair opens as necessary.

**NO**

Test the four data link connector terminals against their ECM connector pins for continuity.

<table>
<thead>

</tr>
<tr>
<td>4</td>
<td>GY</td>
</tr>
</tbody>
</table>

Continuity present in all four circumstances?
GENERAL

If the engine stop switch is set to RUN with the engine off, and the ignition key switch is turned ON, the check engine lamp should illuminate for four seconds. See Figure 4-12.

Battery voltage is supplied to the lamp bulb. The lamp bulb is grounded by the ECM through the BK/Y wire. A lack of power to the ECM will cause the check engine lamp to be inoperative and also create a no start situation.

DIAGNOSTICS

Diagnostic Tips

Check for the following conditions:

- Check for open in BK/Y wire.
- Check for blown accessory fuse.

Diagnostic Notes

The reference numbers below correlate with the circled numbers on the Test 4.9 flow chart.

1. Use HARNESS CONNECTOR TEST KIT (Part No. HD-41404), black pin probe and patch cord.
2. See Figure 4-13. Inspect connector [10] (black) for contamination or corrosion. If connection is good, replace ECM. See 4.29 ELECTRONIC CONTROL MODULE.
Figure 4-14. Check Engine Lamp Circuit

Table 4-9. Wire Harness Connectors in Figure 4-14.

<table>
<thead>
<tr>
<th>NO.</th>

</tbody>
</table>
Set engine stop switch to OFF. Disconnect ECM connector [10] and connect Breakout Box. Turn ignition key switch ON. Jumper Breakout Box (BK) Pin 7 to ground. Check engine lamp should be ON. Is it?

Did check engine lamp and no start conditions occur simultaneously?

No ECM power. Refer to 4.12 NO ECM POWER.

Refer to 4.11 ENGINE CRANKS BUT WILL NOT START for no start condition and then return to 4.9 CHECK ENGINE LAMP NOT ILLUMINATED AT KEY ON to resolve no engine check lamp.

Replace ECM. See 4.29 ELECTRONIC CONTROL MODULE.

Disconnect instruments connector [39]. Remove BK/Y wire from connector [39] and ground it. Reconnect connector [39]. Check engine lamp ON?

Repair open or short to voltage on BK/Y wire between connector [39] and connector [10B].

Repair open on O wire that feeds bulb or open on wire from bulb to connector [39].
GENERAL
See Figure 4-15. If the engine stop switch is set to RUN with the engine off, and the ignition key switch is turned ON, the check engine lamp should illuminate for four seconds.
Following the initial period of illumination, the lamp should go off for four seconds. It may then come back on for an eight second period (for a stored error) or remain on continuously (current error).

DIAGNOSTICS
Diagnostic Notes
See Figure 4-17. The reference numbers correlate with the circled numbers on the Test 4.10 flow chart.
1. See Figure 4-15. If the lamp goes off when the black ECM connector [10] is unplugged, the BK/Y wire is not shorted to ground.
Figure 4-17. Check Engine Lamp Circuit

Table 4-10. Wire Harness Connectors in Figure 4-17.

<table>

</tr>
</tbody>
</table>
Turn ignition key switch OFF. Disconnect black ECM connector [10]. Turn ignition key switch ON. Check engine lamp should be OFF. Is it?

YES

With ignition key switch OFF, reconnect black ECM connector [10]. With ignition key switch ON, verify that there is NOT a 4 second lamp OFF period. Is there a lamp OFF period?

YES

Check engine lamp function OK. Check for trouble codes. See 4.4 CHECKING FOR TROUBLE CODES.

NO

Resolve short to ground on BK/Y wire between connector [39] and connector [10].

NO

Replace ECM. See 4.29 ELECTRONIC CONTROL MODULE.
GENERAL

If the starter will not crank engine, the problem is not ignition related. See Section 5-Electric Starter.

IMPORTANT NOTE
The engine may be started and run when the trouble codes are received using a jumper wire on Pins 1 and 2 of the data link connector. However, if the jumper wire is removed with the engine running, the check engine lamp will continue to flash trouble codes. To stop check engine lamp from flashing codes, turn engine stop switch OFF.

DIAGNOSTICS

Diagnostic Notes

The reference numbers below correlate with the circled numbers on the Test 4.11 flow charts.

1. Connect BREAKOUT BOX (Part No. HD-42682) between harness and ECM. See 4.6 BREAKOUT BOX.
2. Check battery condition. Perform a voltage test and recharge if below 12.80 volts. Check battery connections and perform load test. Replace the battery if necessary.
3. Remove spark plug cable from spark plug.
   a. Visually check condition of plug.
   b. See Figure 4-18. Attach cable to SPARK PLUG TESTER (Part No. HD-26792). Clip tester to cylinder head bolt.
   c. While cranking starter, look for spark. Repeat procedure on other spark plug cable.

   ! WARNING

   The gasoline in the fuel supply line downstream of the fuel pump is under high pressure (49 psi [338 kPa]). To avoid an uncontrolled discharge or spray of gasoline, always purge the system of high pressure gas before servicing the fuel system. Gasoline is extremely flammable and highly explosive. Inadequate safety precautions could result in death or serious injury.

4. Purge fuel line of high pressure gasoline. See 4.38 FUEL PUMP.

5. Access fuel injectors.
   a. Remove right side air scoop. See 2.36 AIR SCOOPS.
   b. Remove airbox to access fuel injectors. See 4.43 AIRBOX.
6. Use injector test light (Part No. HD-34730-2C) as shown in Figure 4-19.
7. Use HARNESS CONNECTOR TEST KIT (Part No. HD-41404) gray pin probe and patch cord.

Table 4-11. Wire Harness Connectors in Figure 4-20.
Figure 4-20. Ignition Circuit
**Test 4.11 (Part 1 of 3)**

- **Is fresh gasoline in tank?**
  - **YES**
    - Check for trouble codes. See 4.4 CHECKING FOR TROUBLE CODES. Codes found?
      - **NO**
        - Fill tank with fresh gasoline.
      - **YES**
        - Connect Breakout Box. Measure voltage between connector 10 (BK) pin 10 (+) and pin 11 (-) Voltage should be 0.25-2.7 volts (Run Mode). Is it?
          - **NO**
            - See 4.26 TROUBLE CODE 44.
          - **YES**
            - NO pump response, but light OK. See 4.13 FUEL PRESSURE TEST.
            - Short pump response, light OK. See 4.26 TROUBLE CODE 44.
  - **NO**
    - Refer to applicable trouble code chart. Start with lowest code
      - **YES**
        - Check battery connections. Check battery voltage. Is voltage above 12.8 volts?
          - **NO**
            - Recharge battery.
          - **YES**
            - Does battery pass load test?
              - **NO**
                - Replace battery.
              - **YES**
                - Place transmission in neutral. Turn ignition key switch ON and set engine stop switch to RUN. Did fuel pump run 2-3 seconds and check engine lamp illuminate?
                  - **NO**
                    - No pump response or light. See to 4.12 NO ECM POWER.
                    - Short pump response, light OK. See 4.26 TROUBLE CODE 44.
                  - **YES**
                    - No pump response, but light OK. See 4.13 FUEL PRESSURE TEST.
                    - Pump OK, but no light. See 4.9 CHECK ENGINE LAMP NOT ILLUMINATED AT KEY ON.
    - See 4.11 (Part 2 of 3).

**STOP**

**Incorporate FUEL PRESSURE TEST.**

---

**2003 Buell XB9S: Fuel System**  4-25
Continued from Test 4.11 (Part 1 of 3).

Check spark plug condition. Replace if fouled. Check spark at both plugs while cranking. Spark present?

YES

YES

Check engine compression. See 3.2 ENGINE.

7210

Correct problems found under 4.21 TROUBLE CODES 23 AND 32.

7205

NO

Check for battery voltage at Terminal B of coil connector [83] using DVOM. Power present after key ON?

YES

Disconnect coil connector [83]. Connect test lamp to connector [83] Terminal A (front cylinder) or Terminal C (rear cylinder). Crank engine. Does light flash?

YES

Open in GY wire between splice for fuel pump wire and ignition coil. Repair open.

7215

NO

NO

Connect Breakout Box. Check continuity between ignition coil Terminal A of connector [83] and Breakout Box (BK) Pin 7. Measure resistance between ignition coil Terminal C and ECM Pin 6 [10B]. Resistance should be less than 1.0 ohm. Is it?

YES

Test spark plug cable resistance. See 4.15 MISFIRE. Resistance OK?

YES

Inspect spark plugs. Good?

YES

Replace ignition coil.

7220

NO

Replace spark plug cables.

7520

NO

Replace spark plugs.

7220

NO

No

Go to Test 4.11 (Part 3 of 3).

STOP

Disconnect cam position sensor connector [14]. With ignition ON, measure voltage between Terminal A (+) and Terminal C (-) of connector [14B]. Is 5 volts present?

YES

YES

Check for continuity between Terminal A connector [14B] and ground. Continuity present?

YES

Repair short to ground.

7875

NO

Replace ECM. See 4.29 ELECTRONIC CONTROL MODULE.

7870

NO

Replace spark plugs.

7520

YES

Repair open circuit.

7875

NO

Check spark plug condition. Replace if fouled. Check spark at both plugs while cranking. Spark present?

NO

NO

Check for battery voltage at Terminal B of coil connector [83] using DVOM. Power present after key ON?
Continued from Test 4.11 (Part 2 of 3).

Reconnect cam position sensor connector [14]. Measure voltage between Pin 3 and Pin 7 of Breakout Box (GY). Voltage should alternate between 0 and 5 volts while cranking. Does it?

YES

Problem may be intermittent. Verify that connectors [10], [11] and [14] are reconnected. Remove Breakout Box and try to start vehicle. Will vehicle start?

YES

With engine running, wiggle cam position sensor and wires to identify any loose connects (engine misfires or stalls.) Any found? 7952

NO

Pinion gear key failure, loose rotor cup or other mechanical failure. 7945

YES

Replace cam position sensor. See 4.30 CAM POSITION SENSOR AND ROTOR. 7952

NO

7945

Mechanical failure. Inspect for loose rotor cup and sheared pinion gear key.
GENERAL

A relay controlled by the engine stop switch supplies power to the ECM. The relay requires a ground to operate. If the ground is not established, the ECM will not receive power. Grounds may be established three ways.

- By placing the motorcycle in neutral and grounding the relay through the neutral switch. See Figure 4-21.
- By retracting the sidestand and grounding the relay through the sidestand switch. See Figure 4-22.
- By disengaging the clutch and grounding the relay through the clutch switch. See Figure 4-23.

If the ECM does not appear to be receiving power, check the ground sources. A blown ignition fuse or ECM fuse can also disable the ECM.

DIAGNOSTICS

Diagnostic Notes

The reference numbers below correlate with the circled numbers on the Test 4.12 flow chart.

1. Connect BREAKOUT BOX (Part No. HD-42682) to ECM. See 4.6 BREAKOUT BOX.
The diagram illustrates the ECM power circuit, showing various connections and components such as Ignition Switch, Side Stand Switch, Neutral Switch, and Diode 1 & 2. It also includes a fuse block and relay center. The key components and their connections are detailed in the accompanying table.

**Table 4-12. Wire Harness Connectors in Figure 4-24.**

No ECM Power

CONDITION: Sidestand up, key ON and transmission in neutral

Check ignition fuse and ECM fuse. Are fuses OK?

YES

NO

Attach Breakout Box (HD-42682) to ECM. Check for 12 volts on ECM connector [10] Pin 1 (+) and Pin 2 (-). Voltage present?

YES

NO

Replace ECM. See 4.29 ELECTRONIC CONTROL MODULE.

7271

Check for continuity to ground on [10] Pin 2. Continuity present?

YES

NO

Repair open between ECM and ignition relay.

7273

Check for 12 volts on ignition relay Terminal 87 (GY). Voltage present?

YES

NO

Replace fuse(s) as needed.

7114

Check for continuity to ground on ignition relay Terminal 85 (TN/W). Continuity present?

YES

NO

Diagnose ignition interlock circuit. See 7.5 STARTER INTERLOCK and continue until problem is solved.

Check for 12 volts on [10] Pin 30 (GY/O). Voltage present?

YES

NO

Repair open on (GY/O) wire between ignition relay and fuse.

7272

Check for 12 volts on right handlebar connector [22A] GY/O wire. Voltage present?

YES

NO

Replace handlebar switch assembly.

7276

Repair open on GY/O wire between connector [22] and ignition relay.

7277

Replace ignition relay. See 7.5 STARTER INTERLOCK.

7274

Repair open on (GY/O) wire between ignition relay and fuse.

Check for 12 volts on right handlebar connector [22A] W/BK wire. Voltage present?

YES

NO

Replace handlebar switch assembly.

Repair open on W/BK wire between connector [22] and ignition relay.
FUEL PRESSURE TEST

INSPECTION

<table>
<thead>

<th>SPECIALTY TOOL</th>
</tr>
</thead>
<tbody>
<tr>
<td>B-45522</td>
<td>Fuel pressure gauge adapter</td>
</tr>
<tr>
<td>HD-41182</td>
<td>Fuel pressure gauge</td>
</tr>
</tbody>
</table>

**WARNING**

The gasoline in the fuel supply line downstream of the fuel pump is under high pressure (49 psi [338 kPa]). To avoid an uncontrolled discharge or spray of gasoline, always purge the system of high pressure gas before attaching fuel pressure gauge. Gasoline is extremely flammable and highly explosive. Inadequate safety precautions could result in death or serious injury.

1. Remove airbox. See 4.43 AIRBOX.
2. Purge the fuel supply line of high pressure gasoline.
   a. See Figure 4-25. Disconnect the 4-place fuel pump connector [86]. The connector is located inside the left rear portion of the fuel tank/frame.
   b. With the motorcycle in neutral, start the engine and allow vehicle to run.
   c. When the engine stalls, press the starter button for 3 seconds to remove any remaining fuel from fuel line.

**WARNING**

A small amount of gasoline will drain from the valve when the gauge is installed. Thoroughly wipe up any spilt fuel immediately. Dispose of rags in a suitable manner. Gasoline is extremely flammable and highly explosive. Inadequate safety precautions could result in death or serious injury.

3. See Figure 4-26. Depress button (2) of fuel line connector and disconnect the fuel line (3) from throttle body inlet (1).
4. See Figure 4-27. Attach FUEL PRESSURE GAUGE ADAPTER (Part No. B-45522) (2) to throttle body inlet (1).
5. Connect the fuel line (3) to fuel pressure gauge adapter.

**NOTE**

See Figure 4-28. Verify that fuel valve (2) and air bleed petcock (5) on the gauge are closed.

6. Attach FUEL PRESSURE GAUGE (Part No. HD-41182) (4) to fuel pressure gauge adapter (1).
7. See Figure 4-25. Attach fuel pump connector [86] to main wiring harness.

8. See Figure 4-28. Pressurize the fuel system.
   a. Start and idle engine to pressurize the fuel system.
   b. Open fuel valve (2) on fuel pressure gauge to allow fuel to flow down the gauge hose.
   c. Position the air bleed tube (3) into proper container.
   d. Open and close the air bleed petcock (5) to purge the fuel pressure gauge and hose of air. Repeat this step several times until only solid fuel (without bubbles) flows from the air bleed tube.
   e. Close the air bleed petcock.

9. Open throttle and increase engine speed to 2500-3000 RPM. Note the reading on the pressure gauge.
   a. If pressure is 49-51 PSI (338-352 kPa) then system is operating within limits.
   b. If pressure is not within limits, see Test 4.13 (Part 1 of 2) flow chart after disconnecting pressure gauge.

**WARNING**

A small amount of gasoline will drain from the valve when the valve is removed. Thoroughly wipe up any split fuel immediately. Dispose of rags in a suitable manner. Gasoline is extremely flammable and highly explosive. Inadequate safety precautions could result in death or serious injury.

10. See Figure 4-28. Turn engine off. Detach pressure gauge (4) from adapter (1).
    a. Open the air bleed petcock (5) to relieve fuel system pressure and purge the pressure gauge of gasoline.
    b. Remove pressure gauge from adapter.

11. Detach adapter from vehicle.
12. Connect fuel line to throttle body inlet.

**DIAGNOSTICS**

**Diagnostic Notes**

The reference numbers below correlate with the circled numbers on the Test 4.13 flow charts.

1. Use HARNESS CONNECTOR TEST KIT (Part No. HD-41404), gray socket probe and patch cord.
2. Connect BREAKOUT BOX (Part No. HD-42682) to ECM. See 4.6 BREAKOUT BOX.
Table 4-13. Wire Harness Connectors in Figure 4-29.

Run fuel pressure test as described under 4.13 FUEL PRESSURE TEST. Fuel pressure should remain steady at 49-51 PSI (338-352 kPa). Does it?

**NO**

Check for faulty fuel pump and replace. See 4.38 FUEL PUMP.

**YES**

Check for restricted pump inlet screen. Is screen restricted?

**NO**

Check for faulty fuel pump and replace. See 4.38 FUEL PUMP.

**YES**

Flush out fuel cell.

See 4.38 FUEL PUMP.

---

Check for restricted pump inlet screen. Is screen restricted?

**YES**

Locate and repair poor connection between ignition relay and fuel pump.

**NO**

Check for faulty fuel pump and replace. See 4.38 FUEL PUMP.

---

Locate and repair poor connection between battery and ignition relay.

---

Move negative (-) probe to GY wire on Terminal 87 of ignition relay. Measure voltage during first two seconds after key ON. Is voltage greater than 1 VDC?

---

Move negative (-) probe to GY/O wire on Terminal 30 of ignition relay. Measure voltage during first two seconds after key ON. Is voltage greater than 1 VDC?

---

Move negative (-) probe to GY/O wire on Terminal 87 of ignition relay. Measure voltage during first two seconds after key ON. Is voltage greater than 1 VDC?
Continued from Test 4.13 (Part 1 of 2).

Check for battery voltage at GY wire Terminal D on fuel pump connector [86A]. Is battery voltage present?

YES

1. Connect test lamp to battery positive (+) terminal. Probe BN/Y wire at [86A] during the first two seconds after key ON. Does test lamp light?

YES

NO

Locate and repair open in GY wire.

7463

NO

Inspect fuel pump wiring. Is wiring OK?

YES

Replace fuel pump assembly. See 4.36 FUEL PUMP.

7462

NO

Repair fuel pump wiring.

7463

2. Connect Breakout Box (HD-42682) to ECM. Check continuity between [86A] Terminal C (BN/Y wire) and ECM connector [10] (black) Terminal 3. Is continuity present?

YES

Locate and repair open on BN/Y wire.

7463

NO

Replace ECM. See 4.29 ELECTRONIC CONTROL MODULE.

7463

NO

Replace fuel pump assembly. See 4.38 FUEL PUMP.
ADJUSTMENTS

CAUTION

Setting the idle below the recommended speed can result in hard starting, especially in cold ambient temperatures.

See Figure 4-30. The idle speed control cable (1) is located on the left side of the vehicle between the front cylinder head and the ram air scoop assembly (2). Idle speeds are listed in 4.1 SPECIFICATIONS. A 3/16 in. allen wrench may be used to turn adjuster knob.

Table 4-14. Engine Idle Speeds

<table>
<thead>
<tr>
<th>MODEL</th>
<th>REGULAR IDLE</th>
</tr>
</thead>
<tbody>
<tr>
<td>XB9S</td>
<td>1050-1150</td>
</tr>
</tbody>
</table>

CAUTION

Idle adjuster is located near the engine and could be extremely hot. Use suggested tool for adjusting the idle speed. Failure to comply could result in minor or moderate injury.

The idle speed should be adjusted when the engine is at normal operating temperature.

NOTE

An idle speed too low can cause poor throttle response. An idle speed too high can cause a slow return to idle.

See 1.16 THROTTLE CABLE AND IDLE SPEED ADJUSTMENT for more information on idle speed adjustment.
MISFIRE

GENERAL

Misfire At Idle or Under Load

Misfire conditions may be caused by:

- Battery condition and connections.
- Fuel system problems. See tables under 4.8 INITIAL DIAGNOSTIC CHECK.

DIAGNOSTICS

Diagnostic Notes

The reference numbers below correlate with the circled numbers on the Test 4.15 flow charts.

1. See Figure 4-31. A SPARK TESTER (Part No. HD-26792) must be used to verify adequate secondary voltage (25,000 volts) at the spark plug.
   a. Turn ignition switch OFF.
   b. Remove spark plug cable from spark plug. Visually check plug condition.
   c. Attach cable to SPARK TESTER. Clip tester to cylinder head bolt.
   d. While cranking engine, watch for spark to jump tester gap on leads.
   e. Reinstall and repeat procedure on other spark plug cable.

2. Perform spark plug cable resistance test.
   a. Remove spark plug cable from spark plug and ignition coil. See 7.4 SPARK PLUG CABLES.
   b. Using an ohmmeter, touch probes to terminals on each end plug wire.
   c. Compare resistance values to Table 4-15. Replace cables not meeting specifications. Reinstall and repeat procedure on other spark plug cable.

3. If carbon tracking is evident, replace ignition coil and inspect spark plug wires. Wires must be clean and tight. Excessive wire resistance or faulty connections can cause coil damage. See 4.31 IGNITION COIL.

4. This test can also be performed by substituting a known good coil for one causing the no spark condition. The coil does not require full installation to be functional. Verify faulty coil by performing resistance test. See 4.31 IGNITION COIL.

5. Use HARNESS CONNECTOR TEST KIT (Part No. HD-41404) gray pin probe and patch cord.

Test 4.15 (Part 1 of 2)

Is fuel contaminated?

YES

Drain and flush tank. Refill with fresh fuel.

NO

Use Spark Tester to check cables. See 4.11 ENGINE CRANKS BUT WILL NOT START. Did spark jump gap on both leads?

YES

NO

Check for:
- Faulty, worn or cracked spark plug(s).
- Plug fouling due to engine mechanical fault.
- Faulty or poor connection at plug.

Check resistance of each spark plug cable that did not fire the Spark Tester.
Also, check for faulty plug wire connections and wire boots for carbon tracking.

Are wires OK?

YES

NO

Coils should be free of carbon tracking. Are they?

YES

Replace faulty wires.

NO

Replace ignition coil.

Switch coil with unit known to be good. Perform spark test.

Did spark jump gap during engine cranking?

YES

Original ignition coil is faulty. Replace.

NO

STOP

Go to Test 4.15 (Part 2 of 2).
Continued from Test 4.15 (Part 1 of 2).

5

**Discontinue cam position sensor connector [14].** With ignition ON, measure voltage between Terminal A (+) and Terminal C (-) of connector [14B]. Is 5 volts present?

**YES**

Reconnect cam position sensor connector [14]. Measure voltage between Pin 3 and Pin 7 of Breakout Box (GY). Voltage should alternate between 0 and 5 volts while cranking. Does it?

**NO**

**YES**

Repair open circuit.

7240

Check for continuity between Terminal A connector [14B] and ground. Continuity present?

**YES**

Reconnect cam position sensor connector [14]. Measure voltage between Pin 3 and Pin 7 of Breakout Box (GY). Voltage should alternate between 0 and 5 volts while cranking. Does it?

Repair short to ground.

7503

Problem may be intermittent. Verify that connectors [10], [11] and [14] are reconnected. Remove Breakout Box and try to start vehicle. Will vehicle start?

**NO**

With engine running, wiggle cam position sensor and wires to identify any loose connects (engine misfires or stalls.) Any found?

**YES**

Pinion gear key failure, loose rotor cup or other mechanical failure.

**NO**

Mechanical failure. Inspect for loose rotor cup and sheared pinion gear key.

Replace cam position sensor. See 4.30 CAM POSITION SENSOR AND ROTOR.

Replace cam position sensor. See 4.30 CAM POSITION SENSOR AND ROTOR.

With engine running, wiggle cam position sensor and wires to identify any loose connects (engine misfires or stalls.) Any found?

**YES**

Repair.

7503

**NO**

Remove cam timer cover using 1/8 in. drill bit. Crank starter. Does rotor cup rotate?

**YES**

7542

**NO**

Remove cam timer cover using 1/8 in. drill bit. Crank starter. Does rotor cup rotate?

7542

Replace cam position sensor. See 4.30 CAM POSITION SENSOR AND ROTOR.

Replace cam position sensor. See 4.30 CAM POSITION SENSOR AND ROTOR.

**7504**
GENERAL

Throttle Position Sensor

See Figure 4-33. The throttle position sensor (TP sensor) is supplied 5.0 volts from the ECM (5v REF) and sends a signal back to the ECM (TP sensor signal) which varies according to throttle position. The output signal from the TP sensor varies from:

- 0.5-1.5 volts at idle (closed throttle).
- 3.9-4.9 volts at wide open throttle.

A Code 11 will set if the TP sensor signal voltage does not fall within the acceptable range.

NOTE

If the TP sensor is removed and/or replaced, the sensor must be calibrated using Digital Technician (Part No. HD-44750). For replacement of TP sensor see 4.36 THROTTLE POSITION SENSOR.

DIAGNOSTICS

Diagnostic Tips

TP sensor voltage should increase at a steady rate as throttle is moved from idle to wide open throttle. An open or short to ground in R/W or BK/W wires will also result in a Code 11.

Check for the following conditions:

- **Poor connection.** Inspect ECM harness connector for backed out terminals, improper mating, broken locks improperly formed or damaged terminals, poor terminal-to-wire connection and damaged harness.

- **Perform 4.7 WIGGLE TEST to locate intermittents.** If connections and harness check out OK, monitor TP sensor voltage using DVOM while moving related connectors and wiring harness. If the failure is induced, the DVOM display will change.

- **TP sensor scaling.** Observe the TP sensor voltage display while opening the throttle with engine stopped and ignition switch ON. Display should vary from closed throttle TP sensor voltage (when throttle is closed) to greater than 4.0 volts (when throttle is held wide open). As the throttle is slowly moved, the voltage should change gradually without spikes or low voltages being observed.

Diagnostic Notes

The reference numbers below correlate with the circled numbers on the Code 11 flow charts.

1. Connect BREAKOUT BOX (Part No. HD-42682) to ECM. See 4.6 BREAKOUT BOX.
2. Use HARNESS CONNECTOR TEST KIT (Part No. HD-41404), black socket probe and patch cord.
Table 4-17. Wire Harness Connectors in Figure 4-35.

Attach ECM to Breakout Box (HD-42682). Plug DVOM into Pin 2 (+) and Pin 7 (-) of Breakout Box connector [11]. With ignition ON, gradually open throttle while observing voltage. Does voltage steadily increase with no spikes or low voltages observed from 0.5-1.5 volts at idle (closed throttle) to 3.9-4.9 volts at wide open throttle?

**YES**
- Check engine lamp continuously ON and CODE 11 only code set?
  **YES**
  - Replace ECM. See 4.29 ELECTRONIC CONTROL MODULE.
  **NO**
  - Check for intermittents by performing 4.7 WIGGLE TEST. Intermittents present?
  **YES**
  - Replace TP sensor (4.36 THROTTLE POSITION SENSOR). Clear codes and road test. Did check engine lamp come on and set CODE 11?
  **NO**
  - System now OK.
**STOP**

**NO**
- Was voltage greater than 4.9 volts?
  **YES**
  - Connect Breakout Box if not already connected. Disconnect TP sensor connector [88] and ECM connector [11]. Measure voltage at Pin 2 (+) and Pin 7 (-). Does voltage measure 5.0 volts?
  **NO**
  - Go to Code 11 Test (Part 2 of 2).

**At some point in the flow chart you may be instructed to jump directly to a box with the bold asterisk. Disregard the asterisk (but not the instruction box) if your normal progression through the chart brings you to this location.**

Clear codes and confirm proper operation with no check engine lamp. Codes can be cleared using DIGITAL TECHNICIAN (Part No. HD-44750).
2. Connect Breakout Box if not already connected. Check continuity between ECM Pin 2 and chassis ground. Is resistance greater than 1 megaohm?

   YES

      7591

      Disconnect bank angle sensor connector [134]. Measure resistance between connector [88] Terminal A and Terminal C. Is resistance greater than 1 megaohm?

      YES

      NO

      7589

      Replace cam position sensor.

      7589

      Disconnect cam position sensor connector [14]. Measure resistance between connector [88] Terminal A and Terminal C. Is resistance greater than 1 megaohm?

      YES

      NO

      7589

      Replace cam position sensor.

      7589

      Locate and repair short between R/W and BK/W wires. Reconnect [14].

Clear codes and confirm proper operation with no check engine lamp. Codes can be cleared using DIGITAL TECHNICIAN (Part No. HD-44750).
GENERAL

Oxygen (O2) Sensor

See Figure 4-36. The oxygen (O2) sensor provides a signal to the ECM which indicates whether the engine is running rich or lean.

- A low voltage signal (<0.41 V) indicates the engine is running lean.
- A high voltage signal (>0.56 V) indicates the engine is running rich.

When the air/fuel mixture is ideal, approximately 14.7 parts air to 1 part fuel, the voltage will be approximately 0.48 V.

DIAGNOSTICS

Diagnostic Tips

The DVOM displays the signal from the O2 sensor in volts. This voltage will have an average value tending towards lean, rich or ideal value depending on operating temperature of the engine, engine speed and throttle position. An open/short to voltage or short to ground in the V/GY wire will cause the engine to run rich (short to ground) or lean (short to voltage) until fault is detected. Once fault is detected, vehicle will run in open loop. The engine must be running below 5000 RPM for the ECM to detect an O2 sensor failure.

Check for the following conditions:

- Poor connection. Inspect the ECM harness connector [11], fuel injector connectors [84, 85] and O2 sensor connector wiring for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection and damaged harness.

- Dirty/stuck open injectors. The motorcycle may run lean (dirty/clogged injectors) or rich (stuck open injectors) if there is an injector problem. This could also cause poor fuel economy and performance.

- Loose O2 sensor. See Figure 4-37. If the O2 sensor is loose engine performance may be affected. This could also show up as a slow changing O2 sensor voltage.

- Loose/leaking exhaust. This can cause a poor ground connection for sensor or allow fresh air into the exhaust system. If fresh air enters exhaust system, the O2 sensor will read a lean condition, causing the system to go rich.

Diagnostic Notes

1. Connect BREAKOUT BOX (Part No. HD-42682) to ECM. See 4.6 BREAKOUT BOX.
Table 4-18. Wire Harness Connectors in Figure 4-38.

Code 13 Test (Part 1 of 3)

Turn ignition ON and start engine. (Engine must be on and running to read O2 sensor values). Observe O2 voltage. Is it approximately 0.5 volts?

- **YES**
  - Install Breakout Box (HD-42682) leaving harness side connector [11] disconnected from the Breakout Box. Is the O2 voltage approximately 0.5 volts?
    - **YES**
      - Go to Code 13 Test (Part 2 of 3).
    - **NO**
      - 0 volts.
  - **NO**
    - Greater than 1 volt.
      - 1
        - Install Breakout Box (HD-42682) leaving harness side connector [11] disconnected from the Breakout Box. Is the O2 voltage approximately 0.5 volts?
          - **YES**
            - Locate and repair short to ground on V/GY wire.
            - 7656
          - **NO**
            - Replace ECM. See 4.29 ELECTRONIC CONTROL MODULE.
            - 7657
      - **NO**
        - Inspect V/GY wire for shorts to voltage and repair.
        - 7658
        - Replace ECM. See 4.29 ELECTRONIC CONTROL MODULE.
        - 7659

Clear codes and confirm proper operation with no check engine lamp. Codes can be cleared using DIGITAL TECHNICIAN (Part No. HD-44750).
Turn ignition OFF and reconnect O2 sensor. Turn ignition ON and start engine. Allow engine to reach operating temperature. With engine idling, does voltage quickly fluctuate between 0.1-0.8 volts?

**NO.**
- 0.0-0.4 volts.
  - Perform 4.13 FUEL PRESSURE TEST. Pressure too low?
    - **YES**
      - Repair low pressure problem. See 4.13 FUEL PRESSURE TEST.
    - **NO**
      - Check for restricted fuel filter or fuel line. Restriction present?
        - **YES**
          - Replace fuel line or filter.
        - **NO**
          - Check for air leaks at induction module. Air leak present?
            - **YES**
              - Repair.
            - **NO**
              - Fuel injectors may be dirty. See 4.41 THROTTLE BODY.

  - Perform 4.13 FUEL PRESSURE TEST. Pressure too high?
    - **YES**
      - Check for injectors stuck open. See 4.21 TROUBLE CODES 23 AND 32. Retest.
    - **NO**
      - Replace O2 sensor. See 4.32 OXYGEN SENSOR.

**NO.**
- 0.6-1.0 volts.
  - Perform 4.13 FUEL PRESSURE TEST. Pressure too low?
    - **YES**
      - Replace fuel pump. See 4.38 FUEL PUMP.
    - **NO**
      - Check for restricted fuel filter or fuel line. Restriction present?
        - **YES**
          - Replace fuel line or filter.
        - **NO**
          - Check for air leaks at induction module. Air leak present?
            - **YES**
              - Repair.
            - **NO**
              - Fuel injectors may be dirty. See 4.41 THROTTLE BODY.

**NO.**
- Slow or no change.
  - Check continuity between Pin 4 [11] (gray) and [137] (V/GY). Continuity present?
    - **YES**
      - Replace O2 sensor. See 4.32 OXYGEN SENSOR.
    - **NO**
      - Repair open on V/GY wire.

**YES**
- Repair low pressure problem. See 4.13 FUEL PRESSURE TEST.
- Perform 4.13 FUEL PRESSURE TEST. Pressure too low?
- Perform 4.13 FUEL PRESSURE TEST. Pressure too high?
- Check for restricted fuel filter or fuel line. Restriction present?
- Replace fuel pump. See 4.38 FUEL PUMP.
- Check for injectors stuck open. See 4.21 TROUBLE CODES 23 AND 32. Retest.
- Replace O2 sensor. See 4.32 OXYGEN SENSOR.
- Repair open on V/GY wire.
- Repair low pressure problem. See 4.13 FUEL PRESSURE TEST.
- Repair low pressure problem. See 4.13 FUEL PRESSURE TEST.
- Check for restricted fuel filter or fuel line. Restriction present?
- Replace fuel line or filter.
- Check for air leaks at induction module. Air leak present?
- Repair.
- Fuel injectors may be dirty. See 4.41 THROTTLE BODY.

Clear codes and confirm proper operation with no check engine lamp. Codes can be cleared using DIGITAL TECHNICIAN (Part No. HD-44750).
Continued from Code 13 Test (Part 2 of 3).

Turn ignition OFF and reconnect O2 sensor. Turn ignition ON and start engine. Allow engine to reach operating temperature. Does voltage quickly fluctuate between 0.1-0.8 volts?

- **YES**
  - Check for intermittents by performing 4.7 WIGGLE TEST. Intermittents present?
    - **YES**
      - Repair as necessary.
    - **NO**
      - Replace O2 sensor (4.32 OXYGEN SENSOR). Clear codes and road test. Did check engine lamp come on and set CODE 13?
        - **YES**
          - Install original O2 sensor and replace ECM (4.29 ELECTRONIC CONTROL MODULE). Road test again to verify.
        - **NO**
          - System now OK.

- **NO**
  - See Code 13 Test (Part 2 of 3) for diagnostic material.

Clear codes and confirm proper operation with no check engine lamp. Codes can be cleared using DIGITAL TECHNICIAN (Part No. HD-44750).
GENERAL

Engine Temperature Sensor

CAUTION
Do not pull on engine temperature sensor wiring. Excess strain to sensor wiring will cause sensor damage.

See Figure 4-39. The ECM supplies and monitors a 0-5 volt signal to one side of the engine temperature sensor (ET sensor). The other side of the ET sensor is connected to ground through the engine.

See Table 4-19. The ET sensor is a thermistor device which means that at a specific temperature it will have a specific resistance across its terminals. As this resistance varies, so does the supplied voltage.

- At high temperatures, the resistance of the sensor is very low. This effectively lowers the signal voltage.
- At low temperatures, the resistance is very high, allowing the voltage to rise close to the supplied voltage of 5 volts.

The ECM monitors this voltage to compensate for various operating conditions.

DIAGNOSTICS

Diagnostic Tips

An intermittent may be caused by poor connection, rubbed through wire insulation or a wire broken inside the insulation.

Check the following conditions:

- **Poor connection.** Inspect ECM harness connector [11] for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection and damaged harness.

- **Shifted sensor.** The temperature-to-resistance values table may be used to test the ET sensor at various temperature levels in order to evaluate the possibility of a shifted (out-of-calibration) sensor which may result in driveability problems.

Diagnostic Notes

The reference numbers below correlate with the circled numbers on the Code 14 flow charts.

1. Connect BREAKOUT BOX (Part No. HD-42682) to ECM. See 4.6 BREAKOUT BOX.
2. Use HARNESS CONNECTOR TEST KIT (Part No. HD-41404), gray pin probes and patch cord.

Code 14 Test (Part 1 of 2)

Disconnect ET sensor connector [90]. Measure resistance between [90] and body of ET sensor. Is resistance between 33761-74328 ohms when engine is at room temperature (68-86°F [20-30° C])?

**YES**

1. Attach Breakout Box (HD-42682) to ECM. Using a DVOM, measure the resistance between ET sensor connector and ECM Pin 9 of [11]. Is it less than 1.0 ohm?

**NO**

Replace ET sensor. See 4.32 OXYGEN SENSOR.

**YES**

**NO**

Examine PK/Y wire in harness for open circuit and repair.

**YES**

Examine harness for short to ground and repair.

STOP

Go to Code 14 Test (Part 2 of 2).

At some point in the flow chart you may be instructed to jump directly to the box marked by an asterisk. Disregard the asterisk (but not the instruction box) if your normal progression through the chart brings you to this location.

Clear codes and confirm proper operation with no check engine lamp. Codes can be cleared using DIGITAL TECHNICIAN (Part No. HD-44750).
Continued from Code 14 Test (Part 1 of 2).

Connect ECM to Breakout Box. With DVOM still connected, check for intermittents by performing 4.7 WIGGLE TEST. Intermittents present?

YES

While wigging harness to locate source of intermittents, perform the steps under Code 14 Test (Part 1 of 2) marked by Bold Asterisks. Repair as necessary.

NO

Disconnect ET sensor connector. Turn ignition switch ON. Using a DVOM, measure the voltage between ECM Pin 9 of [11] and Pin 2 of [10] on Breakout Box. Is voltage approximately 5 volts?

YES

While wiggling harness to locate source of intermittents, perform the steps under Code 14 Test (Part 1 of 2) marked by Bold Asterisks. Repair as necessary.

NO

Less than 4.7 volts

Replace ET sensor (4.33 ENGINE TEMPERATURE SENSOR), clear codes and road test. Did check engine lamp come on and set only CODE 14?

YES

System OK.

NO

YES

Install original ET sensor, replace ECM (4.29 ELECTRONIC CONTROL MODULE) and road test.

NO

Repair short to ground on PK/Y wire.

7670

7675

7680

7685

7690

Unplug ECM leaving Breakout Box connected at vehicle harness. Measure voltage between ECM Pin 9 of [11] and Pin 2 of [10] on Breakout Box. Is the voltage 0 volts?

YES

Replace ECM. See 4.29 ELECTRONIC CONTROL MODULE.

NO

Replace ECM. See 4.29 ELECTRONIC CONTROL MODULE.

At some point in the flow chart you may be instructed to jump directly to the box marked by an asterisk. Disregard the asterisk (but not the instruction box) if your normal progression through the chart brings you to this location.

Clear codes and confirm proper operation with no check engine lamp. Codes can be cleared using DIGITAL TECHNICIAN (Part No. HD-44750).
GENERAL

Intake Air Temperature Sensor

See Figure 4-41. The ECM supplies and monitors a signal at Pin 10 of [11] to one side of the intake air temperature sensor (IAT sensor). The other side of the IAT sensor is connected to a common sensor ground, which is also connected to the ECM (Pin 7 of [11]).

- **Shifted sensor.** The temperature-to-resistance values table may be used to test the IAT sensor at various temperature levels in order to evaluate the possibility of a shifted (out-of-calibration) sensor which may result in driveability problems.

Diagnostic Notes

The reference numbers below correlate with the circled numbers on the Code 15 flow charts.

1. Connect BREAKOUT BOX (Part No. HD-42682) to EFI harness only (leave ECM disconnected). See 4.6 BREAKOUT BOX.
2. Use HARNESS CONNECTOR TEST KIT (Part No. HD-41404), gray socket probes and patch cord.
3. Use HARNESS CONNECTOR TEST KIT (Part No. HD-41404), gray pin probe and patch cord.

   - Connect ECM to Breakout Box. Check for intermittents by performing 4.7 WIGGLE TEST. Intermittents present?
   - **NO**
   - **STOP**

**Code 15 Test (Part 2 of 2)**

While wigging harness to locate source of intermittents, perform the steps under Code 15 Test (Part 2 of 2) marked by Bold Asterisks. Repair as necessary.

1. **YES**
2. **NO**

Replace IAT sensor (4.35 INTAKE AIR TEMPERATURE SENSOR), clear codes and road test. Did check engine lamp come on and set only CODE 15?

   - **YES**
   - Install original IAT sensor, replace ECM and road test.

   - **NO**
   - System OK.

   - **YES**
   - Repair short to ground on Lt. GN/Y wire.

   - **NO**
   - Replace ECM. See 4.29 ELECTRONIC CONTROL MODULE.

**Code 15 Test (Part 2 of 2)**

Unplug ECM leaving Breakout Box connected at vehicle harness. Measure voltage between ECM Pin 10 of [11] and Pin 2 of [10] on Breakout Box. Is the voltage 0 volts?

   - **YES**
   - Replace ECM. See 4.29 ELECTRONIC CONTROL MODULE.

   - **NO**
   - Replace ECM. See 4.29 ELECTRONIC CONTROL MODULE.

Examine IAT signal wire (Lt. GN/Y) for short to 12 volts and repair.

At some point in the flow chart you may be instructed to jump directly to the box marked by an asterisk. Disregard the asterisk (but not the instruction box) if your normal progression through the chart brings you to this location.

Clear codes and confirm proper operation with no check engine lamp. Codes can be cleared using DIGITAL TECHNICIAN (Part No. HD-44750).
Continued from Code 15 Test (Part 1 of 2)

Disconnect IAT sensor connector [89]. Measure resistance between Pins 1 and 2 of [89] at sensor. With engine at room temperature 60-90° F (15.6-32.2° C), is resistance between 6816-3314 ohms?

YES

Using a DVOM, measure the resistance between IAT sensor connector [89] terminal 1 and ECM Pin 10 on Breakout Box. Is it less than 1.0 ohm?

* Replace IAT sensor. See 4.35 INTAKE AIR TEMPERATURE SENSOR.

NO

Using a DVOM, measure the resistance between IAT sensor connector [89] terminal 2 and ECM Pin 7 on Breakout Box. Is it less than 1.0 ohm?

* Examine Lt. GN/Y wire in harness for open circuit and repair.

YES

Using a DVOM, measure the resistance between ECM Pins 10 and 7 of connector [11] on Breakout Box. Is it greater than 1.0 megaohm?

* Examine BK/W wire in harness for open circuit and repair.

NO

Using a DVOM, measure the resistance between ECM Pin 10 of connector [11] on Breakout Box and ground. Is it greater than 1.0 megaohm?

* Examine Lt. GN/Y wire and BK/W wire in harness for short between these two circuits and repair.

YES

To locate sources of intermittents, wiggle harness while performing steps marked above by Bold Asterisk. Repair as necessary.

NO

Examine harness for short to ground and repair.

* At some point in the flow chart you may be instructed to jump directly to the box marked by an asterisk. Disregard the asterisk (but not the instruction box) if your normal progression through the chart brings you to this location.

Clear codes and confirm proper operation with no check engine lamp. Codes can be cleared using DIGITAL TECHNICIAN (Part No. HD-44750).
GENERAL

Battery Voltage
A Code 16 will set if the ECM detects battery positive voltage less than 6 volts or greater than 20 volts.
- A low voltage condition typically occurs during activation of the starter or generally indicates loose wire connections.
- A high voltage condition is usually caused by a faulty voltage regulator.

DIAGNOSTICS

Diagnostic Notes
The reference numbers below correlate with the circled numbers on the Code 16 flow charts.
1. The ECM is monitoring voltage at ECM connector [10] (black) Terminal 1. Connect BREAKOUT BOX (Part No. HD-42682) to ECM. See 4.6 BREAKOUT BOX.
2. This checks for voltage drops in the ECM power circuit. If a significant voltage drop is not present, condition may be caused by excessive starter current draw.

*ECM [10] Pin 1 also provides power to fuel pump, both fuel injectors and coil.
Code 16 Test (Part 1 of 2)

Perform charging system tests. See 7.6 CHARGING SYSTEM
Charging system OK?

YES

NO

Remove spark plug cables from spark plugs. Attach Breakout Box (HD-42682) to ECM. Measure voltage at ECM Pin 1 (+) and Pin 11 (-) of [10] on Breakout Box while cranking engine. Disregard voltage during first two seconds of cranking. Is voltage above 6.2 volts?

YES

NO

Repair charging system.

System OK.

Measure voltage drop between Battery Positive Terminal (+) and Terminal 87 on ignition relay with key ON. Is voltage drop greater than 0.5 volt?

YES

NO

Check for excessive starter current draw. See 5.6 STARTER SYSTEM TESTING.

Measure voltage drop between Battery Positive Terminal (+) and GY/O Terminal 30 on ignition relay with key ON. Is voltage drop greater than 0.5 volt?

YES

NO

Repair GY wire or terminals.

STOP

Go to Code 16 Test (Part 2 of 2).

Clear codes and confirm proper operation with no check engine lamp. Codes can be cleared using DIGITAL TECHNICIAN (Part No. HD-44750).
Continued from Code 16 Test (Part 1 of 2).

Measure voltage drop between Battery Positive Terminal (+) and GY/O wire Terminal (-) on ignition fuse with key ON. Is voltage drop greater than 0.5 volt?

**YES**

Measure voltage drop between Battery Positive Terminal (+) and R/BK wire Terminal on 15 amp ignition fuse with key ON. Is voltage drop greater than 0.5 volt?

**YES**

Measure voltage drop between Battery Positive Terminal (+) and R/BK wire Terminal of key switch relay with key ON. Is voltage drop greater than 0.5 volt?

**YES**

Measure voltage drop between Battery Positive Terminal (+) and red wire of 30 amp battery fuse with key ON. Is voltage drop greater than 0.5 volt?

**YES**

Measure voltage drop between Battery Positive Terminal (+) and R/Y wire of 30 amp battery fuse with key ON. Is voltage drop greater than 0.5 volt?

**YES**

Replace R/Y wire between battery fuse and battery.

**NO**

Replace fuse or fuse terminals.

**NO**

Repair GY/O wire or terminals.

**NO**

Repair R/BK wire or terminals.

**NO**

Replace key switch relay.

**NO**

Repair R wire or terminals.

**NO**

Replace main fuse.

Clear codes and confirm proper operation with no check engine lamp. Codes can be cleared using DIGITAL TECHNICIAN (Part No. HD-44750).
GENERAL

Front Fuel Injector (Code 23)
And Rear Fuel Injector (Code 32)

See Figure 4-46. The fuel injectors (1, 4) are solenoids that allow pressurized fuel into the engine intake tract. The injectors are timed to the engine cycle and are triggered sequentially.

The power for the injectors comes from the ignition relay. The ignition relay also provides power for fuel pump, ECM and the ignition coils. The ECM provides the path to ground to trigger the injectors.

NOTE
Ignition relay failures or wiring harness problems will cause 12 volt power to be lost to both injectors, ignition coils, ECM and fuel pump.

DIAGNOSTICS

Diagnostic Notes

The reference numbers below correlate with the circled numbers on the Code 23/32 flow charts.

1. Rear fuel injector
2. Clip (2)
3. Fuel rail
4. Front fuel injector

Figure 4-46. Fuel Injectors

![Figure 4-47. Fuel Injector Connector](image)

1. Fuel injector connector
2. Tab

Figure 4-47. Fuel Injector Connector

WARNING

The gasoline in the fuel supply line downstream of the fuel pump is under high pressure (49 psi [338 kPa]). To avoid an uncontrolled discharge or spray of gasoline, always purge the system of high pressure gas before servicing the fuel system. Gasoline is extremely flammable and highly explosive. Inadequate safety precautions could result in death or serious injury.

1. Purge fuel line. See 4.38 FUEL PUMP.
2. Use HARNESS CONNECTOR TEST KIT (Part No. HD-41404), purple pin probes and patch cord.
3. Connect BREAKOUT BOX (Part No. HD-42682) to ECM. See 4.6 BREAKOUT BOX.
4. Use HARNESS CONNECTOR TEST KIT (Part No. HD-41404), purple pin probes and patch cord to BREAKOUT BOX (Part No. HD-42682) and gray socket probes and patch cord to FUEL INJECTOR TEST LAMP (Part No. HD-34730-2C).

Code 23/32 Test (Part 1 of 2)

1. Is connector connected at the injector?
   - YES
     - Disconnect and attach Fuel Injector Test Lamp. Crank engine. Does lamp flash?
       - YES
         - Measure resistance of the suspect injector. Resistance across terminals should be 12.25 ohms? Is it?
           - YES
             - Check Terminal 1 (GY wire) on injector connector to ground. Should be equivalent to battery voltage after key ON. Is it?
               - NO
                 - Go to Code 23/32 Test (Part 2 of 2)
               - YES
                 - Check for loose or corroded terminals in harness. Repair as necessary.
                   - NO
                     - Replace injector. See 4.41 THROTTLE BODY.

   - NO
     - Reconnect and install airbox.

2. Check Terminal 1 (GY wire) on injector connector to ground. Should be equivalent to battery voltage after key ON. Is it?
   - NO
     - Go to Code 23/32 Test (Part 2 of 2)
   - YES
     - Attach Breakout Box (HD-42682) to ECM.
       - If CODE 23, measure resistance between ECM Pin 5 of [10] (W/Y wire) and Terminal 2 of front injector connector [84].
       - If CODE 32, measure resistance between ECM Pin 8 of [10] (GN/GY wire) and Terminal 2 of rear injector connector [95].
         - Is resistance less than 0.5 ohm?
           - YES
             - Repair open or poor connection.
               - NO
                 - Using Breakout Box, check with test lamp between ECM [10] Pin 5 (CODE 23) or ECM [10] Pin 8 (CODE 32) and ECM [10] Pin 1. Does light flash when cranked?
                 - NO
                   - Replace ECM. See 4.29 ELECTRONIC CONTROL MODULE.
                   - YES
                     - Recheck connections. Perform 4.7 WIGGLE TEST. Repair as necessary.

Clear codes and confirm proper operation with no check engine lamp. Codes can be cleared using DIGITAL TECHNICIAN (Part No. HD-44750).
Continued from Code 23/32 Test (Part 1 of 2).

Check for 12 volts at Terminal 87 of the ignition relay. Is voltage present?

**YES**

Ignition relay is OK. Measure resistance between Terminal 87 of the ignition relay and Terminal 2 (W/Y for Code 23 or GN/GY for Code 32) wire at injector connector. Is resistance less than 0.5 ohm?

**YES**

With DVOM still attached, perform 4.7 WIGGLE TEST to locate intermittents. Repair as necessary.

**NO**

Check for multiple codes. See 4.4 CHECKING FOR TROUBLE CODES.

**NO**

Find and repair connection or open wire.

Clear codes and confirm proper operation with no check engine lamp. Codes can be cleared using DIGITAL TECHNICIAN (Part No. HD-44750).
GENERAL

Front Ignition Coil (Code 24)
And Rear Ignition Coil (Code 25)

A Code 24 or 25 will set if the ignition coil rise time is out of range. This could occur if there is an open coil or loss of power to the coil. If both codes are set, it is likely a coil power failure or a coil failure.

See Figure 4-49. The coil receives power from the ignition relay at coil pin B (3) at the same time that the fuel pump and injectors are activated.

DIAGNOSTICS

Diagnostic Notes

The reference numbers below correlate with the circled numbers on the Code 24/25 flow charts.

1. Use HARNESS CONNECTOR TEST KIT (Part No. HD-41404), purple pin probes and patch cord.
2. Connect BREAKOUT BOX (Part No. HD-42682) to ECM. See 4.6 BREAKOUT BOX.
Figure 4-51. Ignition Coil Circuit

Table 4-25. Wire Harness Connectors in Figure 4-51.

</tbody>
</table>
Disconnect coil connector [83]. Attach Test Lamp to [83] as shown in Figure 4-50. 
Crank engine. 
Do test lamp lights flash when cranked?

YES

Faulty coil connection or coil. See 4.31 IGNITION COIL.

NO

Measure voltage on Terminal B of coil. 
Should be equivalent to battery voltage after key is turned ON. 
Is it?

YES 

Measure voltage at ignition relay Terminal 87 after key is turned ON. 
Should be equivalent to battery voltage. Is it?

NO 

Repair open wire or connection on GY wire.

YES 

Check for multiple codes. 
See 4.4 CHECKING FOR TROUBLE CODES.

NO 

Repair open wire or connection.

YES 

Perform 4.7 WIGGLE TEST. Intermittents found?

NO 

Repair as necessary.

YES 

Replace ECM. See 4.29 ELECTRONIC CONTROL MODULE.

NO 

Clear codes and confirm proper operation with no check engine lamp. Codes can be cleared using DIGITAL TECHNICIAN (Part No. HD-44750).
GENERAL

Fuel Pump
The fuel pump assembly is shown in Figure 4-52. ECM Pin 3 provides ground to the fuel pump. Code 33 will set if:

- See Figure 4-53. BN/Y wire is shorted to 12 volts. This will also cause the ignition fuse to blow.
- BN/Y wire is shorted to ground. This will cause the fuel pump to run continuously even when the motor is not running.
- Fuel pump motor stalls or spins without providing fuel pressure.

DIAGNOSTICS

Diagnostic Notes
The reference numbers below correlate with the circled numbers on the Code 33 flow chart.

1. Connect BREAKOUT BOX (Part No. HD-42682) to ECM. See 4.6 BREAKOUT BOX.
2. Use HARNESS CONNECTOR TEST KIT (Part No. HD-41404), red pin probe and patch cord.
3. Use HARNESS CONNECTOR TEST KIT (Part No. HD-41404), gray socket probe and patch cord.

Figure 4-52. Fuel Pump Assembly

**Code 33 Test**

1. **Attach Breakout Box (HD-42682) to ECM.** With DVOM, measure voltage between Pin 3 of [10] and ground after ignition switch is turned ON. Meter should read less than 2 volts and pump should run for 2-3 seconds. Does it?

   - **YES**
     - With DVOM still connected, check for intermittents by performing 4.7 WIGGLE TEST while repeating first test of this flow chart. Intermittents present?
     - **YES**
       - Repair as necessary.
       - Install original fuel pump (4.38 FUEL PUMP) and replace ECM (4.29 ELECTRONIC CONTROL MODULE).
       - System OK.
       - Disconnect ECM. Does fuel pump run continuously?
         - **YES**
           - **Check continuity of BN/Y wire between [10] Pin 3 and Pin C of [86]. Continuity present?**
             - **YES**
               - Locate and repair short to ground on BN/Y wire.
             - **NO**
               - **Repair open.**
         - **NO**
           - **Check continuity of GY wire from ignition relay Terminal 87 to Pin D of [86]. Continuity present?**
             - **YES**
               - **Repair open.**
             - **NO**
               - **Repair open.**
       - **NO**
         - **Check engine lamp come on and set only CODE 33?**
           - **YES**
             - Clear codes and confirm proper operation with no check engine lamp. Codes can be cleared using DIGITAL TECHNICIAN (Part No. HD-44750).
           - **NO**
             - Repair open.

   - **NO**
     - Fuel pump on continuously?
     - **YES**
       - Replace fuel pump. See 4.38 FUEL PUMP. Clear codes and road test. Did check engine lamp come on and set only CODE 33?
       - **YES**
       - **Install original fuel pump (4.38 FUEL PUMP) and replace ECM (4.29 ELECTRONIC CONTROL MODULE).**
     - **NO**
       - **Repair open.**

2. **Check engine lamp come on and set only CODE 33?**

   - **YES**
     - Clear codes and confirm proper operation with no check engine lamp. Codes can be cleared using DIGITAL TECHNICIAN (Part No. HD-44750).
   - **NO**
     - Repair open.
GENERAL

Tachometer
A Code 35 will set if the PK tachometer wire is shorted to power or ground.

DIAGNOSTICS

Diagnostic Notes
The reference numbers below correlate with the circled numbers on the Code 35 flow chart.
1. Connect BREAKOUT BOX (Part No. HD-42682) to ECM. See 4.6 BREAKOUT BOX.
2. Replace instrument module. See 7.18 INSTRUMENT MODULE.

Figure 4-54. Installed Breakout Box

Figure 4-55. Instrument Module Connector [39]

Code 35 Test

1. Attach Breakout Box (HD-42682), but leave connector [10] unplugged at ECM.
   Disconnect instrument connector [39] with ignition ON. Measure voltage across Pin 12 (+) and Pin 11 (-) in open Breakout Box connector [10]. Battery voltage present?

   YES
   Locate and repair short to PK wire to voltage.

   NO
   Check for continuity at Breakout Box between Pin 12 and Pin 11 in connector [10]. Continuity present?

   YES
   Locate and repair short on PK wire to ground.

   NO
   Plug in [10]. Connect voltmeter across Pin 12 and Pin 11 at Breakout Box [10]. Start engine and let motor idle. Is voltage approximately 4.0-6.0 volts?

   YES
   Reconnect [39]. Locate intermittents using 4.7 WIGGLE TEST. Intermittents found?

   NO
   Replace ECM. See 4.29 ELECTRONIC CONTROL MODULE.

   YES
   Repair.

   NO
   Replace instrument module. See 7.18 INSTRUMENT MODULE.
GENERAL

Cooling Fan High Voltage
This code occurs when the engine is running and the ECM has commanded the fan on, and the voltage remains high at pin 6 of ECM connector [11] (gray connector).

NOTE
An engine temperature (ET) sensor signal, indicating a cylinder head temperature above 428° F (220° C), causes the ECM to command the fan on. When ignition is OFF, fan runs at approximately half speed. See Table 4-28. Cooling Fan Specifications.

Table 4-28. Cooling Fan Specifications

<table>
<thead>
<tr>
<th></th>
<th>Key ON</th>
<th>Key OFF</th>
</tr>
</thead>
<tbody>
<tr>
<td>FAN ON</td>
<td>220° C (428° F)</td>
<td>180° C (356° F)</td>
</tr>
<tr>
<td>FAN OFF</td>
<td>170° C (338° F)</td>
<td>150° C (302° F)</td>
</tr>
</tbody>
</table>

This code can also set if fan blade does not spin (blocked fan blade) when fan is commanded on and battery voltage is applied to fan.

Cooling Fan Low Voltage
This code will set when the ignition key is ON and the ECM does not sense voltage at pin 6 of ECM terminal 11 (gray connector).

DIAGNOSTICS

Diagnostic Notes
The reference numbers below correlate with the circled numbers on the Code 36 flow charts.

1. Use HARNESS CONNECTOR TEST KIT (Part No. HD-41404), gray pin probes and patch cord.
2. Connect BREAKOUT BOX (Part No. HD-42682) to ECM. See 4.6 BREAKOUT BOX.
Table 4-29. Wire Harness Connectors in Figure 4-58.

<table>
<thead>
<tr>
<th>NO.</th>

</table>
Code 36 Test (Part 1 of 2-fan runs continuously)

Does cooling fan run continuously?

- **YES**
  - Disconnect gray connector (11) at ECM. Turn IGN switch ON. Does fan run?
  - **NO**
  - Repair short to ground in BK/O wire between ECM and fan.

- **YES**
  - Is engine hot?
    - *NOTE*
      - Fan will be engaged when cylinder head temperature exceeds 300°F (149°C).
  - **NO**
  - Allow engine to cool. Go to **BOLD ASTERISK** on this page.

- **YES**
  - Turn IGN OFF. Connect Breakout Box to ECM gray connector [11]. Turn IGN ON. Measure volts at pin 9 of Breakout Box. Is voltage greater than 1.3 volts?
  - **YES**
    - See 4.18 TROUBLE CODE 14 (engine temperature sensor).
  - **NO**
    - Defective ECM or ECM connection.

- **NO**
  - Go to Code 36 Test (Part 2 of 2-fan does not run).

At some point in the flow chart you may be instructed to jump directly to a the box with the bold asterisk. Disregard the asterisk (but not the instruction box) if your normal progression through the chart brings you to this location.
**Code 36 Test (Part 2 of 2-fan does not run)**

**NO**

**YES**

**Connect Breakout Box to ECM gray connector (leave ECM disconnected). With key ON, check for voltage at pin 6 (gray) of Breakout Box. Is battery voltage present?**

**NO**

**YES**

**Connect jumper wire between pin 6 (gray) of Breakout Box and ground. Does fan run?**

**YES**

**With key ON, check for battery voltage at Y/BN side of fan connector. Is battery voltage present?**

**NO**

**Repair short to ground in Y/BN wire.**

**YES**

**Is there an obstruction preventing fan from rotating?**

**NO**

**Remove obstruction preventing fan rotation.**

**YES**

**Disconnect fan harness at fan. Use ohmmeter to measure resistance between Y/BN terminal and BK terminal of fan connector [97B]. Resistance greater than 1**

**NO**

**Repair open in circuit between pin 6 of ECM gray connector [11] (gray) and BK/O wire of fan connector [97B].**

**YES**

**Check for continuity between pin 6 (gray) of Breakout Box and BK/O wire of fan connector [97A]. Continuity present?**

**NO**

**Repair open in circuit between pin 6 of ECM gray connector [11] (gray) and BK/O wire of fan connector [97B].**

**YES**

**Disconnect fan harness at fan. Place a jumper wire between Y/BN wire and BK wire of fan connector [97A].**

**NO**

**Replace ECM.**

**YES**

**Check for continuity between Y/BN wire and BK/O wire of fan connector [97A]. Continuity present?**

**NO**

**Repair open in circuit between pin 6 of ECM gray connector [11] (gray) and BK/O wire of fan connector [97B].**

**YES**

**Disconnect fan harness at fan. Place a jumper wire between fan Y/BN wire and battery positive. Place a jumper between fan BK wire and ground. Does fan run at full speed?**

**NO**

**System ok.**

**YES**

**Replace fan.**

**System ok.**

**Replace fan.**

**System ok.**

**Replace fan.**
GENERAL

NOTE
See Figure 4-59. When vehicle lean angle causes weighted pendulum to enter shaded area for a period of greater than one second, ECM shuts off ignition and fuel systems.

Bank Angle Sensor
See Figure 4-60. A Code 44 occurs when the bank angle sensor voltage is outside the normal operating range of 0.25-2.7 volts. Refer to Table 4-30. This may be caused by:

● Short to ground in harness between sensor and electronic control module.
● Short to voltage in harness between sensor and electronic control module.
● Failed sensor.

If this code occurs, the engine may stop running. The engine may still be restarted and ridden to the dealership for repair.

DIAGNOSTICS

Diagnostic Notes
The reference numbers below correlate with the circled numbers on the Code 44 flow charts.

1. Use HARNESS CONNECTOR TEST KIT (Part No. HD-41404), gray pin probes and patch cord.
2. Connect BREAKOUT BOX (Part No. HD-42682) to ECM. See 4.6 BREAKOUT BOX.

</tbody>
</table>
Is bank angle sensor connected?

Yes

Disconnect bank angle sensor connector [134]. Measure voltage on [134] between Socket 5 (Lt GY/GN) and Socket 6 (BK/W). What is voltage?

4.75-5.25 volts

Measure voltage between Socket 4 (R/W) and Socket 6 (BK/W). Is voltage 4-6 volts?

Yes

Go to Code 44 Test (Part 2 of 2).

No

Reconnect, clear codes and cycle ignition key. Recheck for codes.

11-13 volts

Repair short to voltage on Lt GY/GN wire.

0 volts

STOP

No

Yes

Is bank angle sensor correctly installed?

Yes

Are ferrous metals located within 0.25 in. (6.4 mm) of sides, face or top of bank angle sensor?

Yes

Return to original configuration.

No

Install properly. See 4.34 BANK ANGLE SENSOR.

STOP

No

Repair open in R/W wire between [134] and harness.

7971

7972

7975

7976
Continued from Code 44 Test (Part 1 of 2).

Disconnect connectors [10] (BK) and [11] (GY) from module and plug into Breakout Box (HD-42682). Check continuity between Socket 5 (Lt GN/GY) on connector [134] and Breakout Box (BK) Pin 10. Is continuity present?

NO

Repair open in Lt GN/GY wire.

YES

Check continuity to ground for Socket 6 (BK/W) and connector [11] Pin 7. Is continuity present?

NO

Repair open in Lt GN/GY wire.

YES

Check continuity to ground for Socket 5 (Lt GN/GY) and connector [134]. Is continuity present?

NO

Repair short to ground on Lt GN/GY wire.

YES

Repair short to ground on Lt GN/GY wire.

Replace ECM. See 4.29 ELECTRONIC CONTROL MODULE.

Clear codes and confirm proper operation with no check engine lamp. Codes can be cleared using DIGITAL TECHNICIAN (Part No. HD-44750).
GENERAL

ECM Failure

All of the following codes indicate a failure which requires replacement of the ECM. See 4.29 ELECTRONIC CONTROL MODULE.

- Code 52 - RAM failure.
- Code 53 - ROM failure.
- Code 54 - EE PROM failure.
- Code 55 - Microprocessor failure.

NOTE

Dealership technicians filing warranty claims should use job/time code 7913 for all Code 52, 53, 54 and 55 ECM replacements.
GENERAL

Cam Sync Failure
This code occurs only when the engine is running if the electronic control module either receives an intermittent (extra or missing) signal from the cam position sensor or receives an unexpected signal. The motorcycle may continue to run, not run normally or stop running altogether.

DIAGNOSTICS

Diagnostic Notes
The reference numbers below correlate with the circled numbers on the Code 56 flow charts.
1. Connect BREAKOUT BOX (Part No. HD-42682) to ECM. See 4.6 BREAKOUT BOX.
2. Use HARNESS CONNECTOR TEST KIT (Part No. HD-41404), black pin probes and patch cord.
3. See 4.30 CAM POSITION SENSOR AND ROTOR.
Table 4-32. Wire Harness Connectors in Figure 4-63.

Attach Breakout Box (HD-42682). Disconnect cam position sensor connector [14]. Turn ignition ON.

Connect voltmeter across Terminal A (R/W wire) and Terminal C (BK/W wire) of connector [14]. Is voltage 4.75-5.25 VDC?

YES  
NO

STOP

Go to Code 56 (Part 1 of 2).

Measure the voltage between Pin 1 and Pin 7 on [11] (GY) using Breakout Box. Is voltage 4.75-5.25 VDC?

YES  
NO

Measure continuity between Pin A on [14] and Pin 1 on [11]. Continuity present?

YES  
NO

YES, 5 volts.  
YES, 12 volts  
NO

Repair open in BK/W wire between connectors [11] and [14].

Repair open in R/W wire between connectors [11] and [14].

Locate and repair R/W wire short to ground.

Locate and repair R/W wire short to voltage.

Replace ECM. See 4.29 ELECTRONIC CONTROL MODULE.

Clear codes and confirm proper operation with no check engine lamp. Codes can be cleared using DIGITAL TECHNICIAN (Part No. HD-44750).
Continued from Code 56 (Part 1 of 2).
Reconnect cam position sensor connector [14]. Using Breakout Box, measure voltage between Pin 3 and Pin 7 while cranking the engine. Does voltage fluctuate between 0-5 volts?

YES

Interrrupten open in GN/W wire or short in BK/W, W/BK or R/W. Perform 4.7 WIGGLE TEST and repair intermittent.

NO

Check for continuity on GN/W wire between Terminal B of connector [14] and Terminal 3 of connector [11]. Continuity present?

YES

Remove timing cover and cam position sensor. Observe rotor cup while cranking engine. Does rotor turn?

NO

Repair.

YES

Check rotor for damage. Is rotor loose or damaged?

NO

Is rotor attached properly?

YES

Replace rotor and retest.

NO

Replace cam position sensor and clear code. Retest. Problem still exist?

YES

Install original cam position sensor. Replace ECM. See 4.29 ELECTRONIC CONTROL MODULE.

NO

System OK.

Clear codes and confirm proper operation with no check engine lamp. Codes can be cleared using DIGITAL TECHNICIAN (Part No. HD-44750).
GENERAL

See Figure 4-64. The Electronic Control Module (ECM) is located under the seat.

REMOVAL

1. Remove seat. See 2.41 SEAT.

WARNING

Always disconnect the negative battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

2. Disconnect and remove battery. See 1.5 BATTERY MAINTENANCE.

4. Remove the two fasteners to detach electronic control module from bracket.

INSTALLATION

1. Align holes in ECM with those in electrical bracket. Install two fasteners and tighten to 48-72 in-lbs (5.4-8 Nm).

WARNING

Always connect the positive battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

3. Install battery by threading positive cable (red) into threaded hole first tightening to 72-96 in-lbs (8-11 Nm). See 1.5 BATTERY MAINTENANCE.

4. Connect negative battery cable.

WARNING

After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

5. Install seat. See 2.41 SEAT.

NOTE

If the ECM was replaced with a new component, it will be necessary to recalibrate Throttle Position Sensor. Throttle position sensor can only be calibrated using DIGITAL TECHNICIAN (Part No. HD-44750).

REMOVAL

**WARNING**

To protect against accidental start-up of vehicle, disconnect the negative battery cable before proceeding. Inadequate safety precautions could result in death or serious injury.

1. Disconnect negative battery cable.
2. Remove sprocket cover. See 2.31 SPROCKET COVER.

**NOTES**

- Make note of cable strap positions and wire routing during disassembly.
- For more information about the wiring located underneath the sprocket cover see 7.25 SPROCKET COVER WIRING.

3. Cut cable straps holding cam position sensor wiring.
4. See Figure 4-66. Disconnect cam position sensor wiring at connector [14].
5. Note position of each cam position sensor wiring terminal in plug end of connector.
6. See Figure 4-68. Remove connector terminal pins (7). See B.2 DEUTSCH ELECTRICAL CONNECTORS under B.1 AMP MULTILOCK ELECTRICAL CONNECTORS.
7. Remove timer cover.
   a. Drill off heads of outer timer cover pop rivets (1) using a 3/8 in. drill bit.
   b. Tap remaining rivet shafts inboard through holes in timer cover (2) and inner cover (20).
   c. Remove timer cover. Remove inner cover screws (3) and inner cover (20).
   d. Carefully remove any remaining pieces of rivets from gearcase cover timer bore.
8. See Figure 4-67. To obtain approximate ignition timing during installation, scribe alignment marks (4) across cam position sensor (3) in two places.
9. See Figure 4-68. Remove timer plate studs (4). Carefully remove cam position sensor. Remove bolt (18) and trigger rotor (17).
10. Carefully remove camshaft oil seal (16) if damaged or if there is any evidence of oil leakage past the seal.
1. Pop rivet (2)
2. Timer cover
3. Screw (2)
4. Timer plate stud (2)
5. Secondary lock
6. Cam position sensor connector [14]
7. Terminal pin
8. Electronic control module (ECM)
9. Spark plug (2)
10. Rear spark plug cable
11. Mounting fastener
12. Ignition coil
13. Front spark plug cable
14. Engine mount
15. Gearcase cover
16. Seal
17. Trigger rotor
18. Trigger rotor bolt
19. Cam position sensor
20. Inner cover
1. See Figure 4-68. Coat lip of seal with a thin film of clean engine oil. With the lipped side facing inboard, install new camshaft oil seal (16) into gearcase cover (15), if removed. Press seal into position until flush with surface of timer bore.

2. Install trigger rotor (17).
   a. Apply LOCTITE 243 (blue) to threads of bolt (18).
   b. Position trigger rotor (17) onto end of camshaft aligning notch with camshaft slot.
   c. Install bolt to secure rotor. Tighten to 43-53 in-lbs (5-6 Nm).

3. Install cam position sensor (19) and timer plate studs (4). Rotate cam position sensor to its previously marked position to obtain approximate ignition timing.

4. Route sensor wiring leads and install cable straps. See 7.25 SPROCKET COVER WIRING.

5. See Figure 4-70. Install sensor wiring terminals into correct positions in plug end of connector [14]. R/W, GN/W and BK/W wires of plug end (from cam position sensor) must match same color wires in receptacle end of connector (from ignition module wiring harness). Install pin terminals. See B.2 DEUTSCH ELECTRICAL CONNECTORS under B.1 AMP MULTILOCK ELECTRICAL CONNECTORS.

6. See Figure 4-68. Attach connector [14] (6).

7. Check ignition timing. See 1.17 IGNITION TIMING.

8. Tighten timer plate studs (4) to 15-30 in-lbs (2-3 Nm).

9. Install inner cover (20) using screws (3). Tighten to 12-20 in-lbs (1-2 Nm).

CAUTION

Use only H-D Part No. 8699 rivets to secure outer timing cover. These rivets are specially designed so that no rivet end falls off into the timing compartment. Use of regular rivets can damage ignition system components and may allow water to enter the timing compartment.

10. Secure timer cover (2) to inner cover using new rivets (1).

11. Connect negative battery cable.
**Troubleshooting**

Follow the troubleshooting procedures listed under 4.8 Initial Diagnostic Check if the engine will not start, is difficult to start or runs roughly. Also check condition of spark plug cables. Insulation on cables may be cracked or damaged allowing high tension current to short to metal parts. This problem is most noticeable when cables are wet.

If poor starting/running condition persists, check resistance of ignition coil primary and secondary windings using an ohmmeter.

**Ignition Coil Primary Circuit Test**

1. Remove ignition coil. See REMOVAL in this section.
2. Set ohmmeter scale to RX1.
3. See Figure 4-71. Place multimeter wires on primary coil windings (1).
4. Check for primary coil winding resistance.
   a. Normal resistance range is 0.5-0.7 ohms.
   b. See TEST RESULTS if resistance is not within normal operating range.

**Ignition Coil Secondary Circuit Test**

1. Remove ignition coil. See 4.31 IGNITION COIL.
2. Set ohmmeter scale to RX1K.
3. See Figure 4-71. Place multimeter wires on secondary coil windings (2).
4. Check for secondary coil winding resistance.
   a. Normal resistance range is 5.5-7.5K ohms.
   b. See TEST RESULTS if resistance is not within normal operating range.

**Test Results**

1. A low resistance value indicates a short in the coil winding. Replace coil.
2. A high resistance value might indicate that there is some corrosion/oxidation of the coil terminals. Clean the terminals and repeat resistance test. If resistance is still high after cleaning terminals, replace coil.
3. An infinite ohms (∞ or no continuity) resistance value indicates an open circuit (a break in the coil winding). Replace coil.

---

**Figure 4-71. Ignition Coil Testing**

**Ignition Coil Substitution**

If a coil tester is not available, use the following test.

**NOTE**

Coil will function without being attached to frame.

1. Substitute a new ignition coil by attaching it to any convenient point near the old coil. Transfer terminal wires to new coil.
2. Attach new spark plug cables to coil and plugs.
3. Test system. If ignition trouble is eliminated by the temporary installation of a new coil, carefully inspect old coil and cables for damage. The insulation on the cables may be cracked or otherwise damaged allowing high tension current to short to metal parts. This is most noticeable in wet weather or after the motorcycle has been washed.
WARNING

To protect against accidental start-up of vehicle, disconnect the negative battery cable before proceeding. Inadequate safety precautions could result in death or serious injury.

1. Disconnect negative battery cable.
2. Remove intake cover assembly. See 2.35 INTAKE COVER ASSEMBLY.
3. Remove airbox. See 4.43 AIRBOX.
4. See Figure 4-72. Disconnect the spark plug cables from the coil plug posts (1, 5).
5. Detach connector (3) [83].
6. Remove coil fasteners (2).

INSTALLATION

NOTE

To ease installation, install spark plug cables to ignition coil first.

1. Connect spark plug cables to ignition coil.
2. See Figure 4-72. Attach coil to frame with fasteners (2). Tighten to 120-144 in-lbs (13.6-16.3 Nm).
3. Attach front and rear spark plug cables to ignition coil posts.
4. Attach connector (3) [83].
5. Install ram air scoop assembly. See 2.36 AIR SCOOPS.
6. Install airbox. See 4.43 AIRBOX.
7. Install intake cover assembly. See 2.35 INTAKE COVER ASSEMBLY.
8. Connect negative battery cable.
GENERAL

See Figure 4-74. The oxygen sensor (O2 Sensor), located in the rear header pipe, monitors oxygen content in the exhaust gas and converts it to a voltage reading. This voltage reading is used by the ECM to maintain the proper air/fuel ratio during closed loop operation.

REMOVAL

**WARNING**

To protect against accidental start-up of vehicle, disconnect the negative battery cable before proceeding. Inadequate safety precautions could result in death or serious injury.

1. Disconnect negative battery cable.
2. Remove intake cover assembly. See 2.35 INTAKE COVER ASSEMBLY.
3. Remove airbox assembly. See 4.43 AIRBOX.
4. Remove shock absorber. See 2.22 REAR SHOCK ABSORBER.
5. Remove cooling fan. See 4.37 COOLING FAN.
6. See Figure 4-75. Remove cable straps (2). Unplug 1-place connector [137] (1).
7. Remove oxygen sensor from exhaust header using Snap-on Part No. YA8875.

INSTALLATION

1. Apply LOCTITE ANTI-SEIZE LUBRICANT to threads of sensor. Make sure anti-seize is marked as safe for use with O2 sensors.
2. See Figure 4-74. Thread sensor into exhaust header. Tighten sensor to 40-45 ft-lbs (54-61 Nm).
3. Install cooling fan. See 4.37 COOLING FAN.
4. Install shock absorber. See 2.22 REAR SHOCK ABSORBER.
5. See Figure 4-75. Connect 1-place connector [137] (1) to wiring harness.
6. Install cable straps (2).
7. Install airbox assembly. See 4.43 AIRBOX.
8. Install intake cover assembly. See 2.35 INTAKE COVER ASSEMBLY.
9. Connect negative battery cable.
GENERAL

See Figure 4-76. The Engine Temperature Sensor (ET Sensor), located in the rear cylinder head, monitors the engine temperature close to the combustion chamber. In addition to aiding the ECM in monitoring the operation of the engine, it is also used to warn the operator of potentially damaging temperatures by causing the CHECK ENGINE lamp to blink during operation.

REMOVAL

WARNING

To protect against accidental start-up of vehicle, disconnect the negative battery cable before proceeding. Inadequate safety precautions could result in death or serious injury.

1. Disconnect negative battery cable.
2. Remove intake cover assembly. See 2.35 INTAKE COVER ASSEMBLY.
3. Remove airbox. See 4.43 AIRBOX.
4. See Figure 4-77. Remove right upper tie bar fastener (2). Rotate tie bar to provide access to sensor.

CAUTION

Do not pull on engine temperature sensor wiring. Excess strain to sensor wiring will cause sensor damage.

5. Unplug 1-place ET Sensor connector (1) [90] above rear cylinder head.
6. Slide rubber boot up ET sensor wire.
7. Remove sensor from rear cylinder head using Snap-on socket M3503B.
CAUTION

Do not pull on engine temperature sensor wiring. Excess strain to sensor wiring will cause sensor damage.

1. See Figure 4-76. Screw sensor into rear cylinder head.

   NOTE
   In next step, make sure wire is in cutout portion (slot) of socket to prevent damage.

2. Secure sensor with Snap-on socket M3503B. Tighten ET sensor to 120-168 in-lbs (13.6-19 Nm).

   NOTE
   Orient the rubber boot so the flat on the boot is towards the left side of the motorcycle.

3. Push rubber boot down sensor wire towards cylinder head until it seats in hole on top of ET sensor.

4. See Figure 4-77. Connect ET sensor 1-place connector [90] to wiring harness.

5. Install right upper tie bar fastener (2). Tighten fastener to 25-27 ft-lbs (33.9-36.6 Nm).

6. Install airbox. See 4.43 AIRBOX.

7. Install intake cover assembly. See 2.35 INTAKE COVER ASSEMBLY.

8. Connect negative battery cable.
GENERAL

The Bank Angle Sensor (BAS), located under the seat, provides input to the ECM on vehicle lean angle. If vehicle lean angle exceeds predetermined bank angle limit, the Bank Angle Sensor will shut off power to the ignition and fuel pump.

REMOVAL

1. Remove seat. See 2.41 SEAT.

**WARNING**

To protect against shock and accidental start-up of vehicle, disconnect the negative battery cable before proceeding. Inadequate safety precautions could result in death or serious injury.

2. Disconnect negative battery cable.
3. See Figure 4-78. Remove screws and washers to detach sensor from seat latch bracket.
4. Unplug bank angle sensor connector [134] and remove.

INSTALLATION

1. See Figure 4-78. Install bank angle sensor connector [134].
2. Position bank angle sensor on seat latch bracket. Make sure locating post on sensor engages hole in mounting tab.
3. Install bank angle sensor to mounting tab with fasteners and new locknuts. Tighten fastener to 12-36 in-lbs (1.4-4.1 Nm).

**WARNING**

Always connect the positive battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

4. Connect negative battery cable.

**WARNING**

After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

5. Install seat. See 2.41 SEAT.
GENERAL

See Figure 4-79. The intake air temperature sensor (IAT Sensor), located on the airbox baseplate, measures the air temperature allowing the ECM to calculate the density of the air entering the manifold. The IAT is a thermistor type sensor.

REMOVAL

**WARNING**

To protect against shock and accidental start-up of vehicle, disconnect the negative battery cable before proceeding. Inadequate safety precautions could result in death or serious injury.

1. Disconnect negative battery cable.
2. See Figure 4-79. Remove airbox cover, filter. Remove fasteners securing base. See 4.43 AIRBOX.
3. Raise base and pull IAT sensor from sensor grommet.
4. Disconnect connector [89] from intake air temperature sensor.
5. Inspect sensor grommet for damage and replace as required.

INSTALLATION

1. Connect IAT sensor connector [89] to wiring harness.
2. Install IAT sensor into grommet on air cleaner base from underneath.
3. Install airbox. See 4.43 AIRBOX.
4. Install negative battery cable.
REMOVAL

1. Remove airbox. See 4.43 AIRBOX.
2. See Figure 4-80. Disconnect throttle position sensor connector [88].
3. See Figure 4-81. Remove two screws and washers to detach TP sensor.

INSTALLATION

1. See Figure 4-81. Apply LOCTITE 222 (purple) to threads of fasteners.
2. Install fastener into lower mounting hole of sensor prior to installation.
3. Attach TP sensor with both fasteners and washers. Tighten to 16-20 in-lbs (1.8-2.3 Nm).
4. See Figure 4-82. Attach throttle position sensor connector [88]. Slots on female connector [88B] must fully engage tabs on male connector housing [88A].

   NOTE
   Throttle position sensor can only be calibrated using DIGITAL TECHNICIAN (Part No. HD-44750).
5. Calibrate throttle position sensor.
GENERAL

The XB9S has a computer-controlled cooling fan to assist in engine cooling during operation in high temperatures. Fan actuation is controlled by the ECM. See Table 4-35. Cooling Fan Specifications.

Table 4-35. Cooling Fan Specifications

REMOVAL

1. Remove seat. See 2.41 SEAT.

WARNING

To protect against shock and accidental start-up of vehicle, disconnect the negative battery cable before proceeding. Inadequate safety precautions could result in death or serious injury.

2. Disconnect negative battery cable.

3. Remove shock absorber. See 2.22 REAR SHOCK ABSORBER.

4. See Figure 4-83. Remove cooling fan fasteners (1).

5. Rotate fan clockwise (looking towards front of vehicle) to remove.

6. See Figure 4-84. Disconnect cooling fan connector [97].

INSTALLATION

1. See Figure 4-84. Connect cooling fan connector [97].

NOTES

- When installing cooling fan (3), be sure wiring, transmission vent hose and fuel line are routed through notch (2) in fan body.

- On California models, both fuel tank and canister vent hoses are routed through notch in fan body.

2. Install fan and rotate counterclockwise into position.

3. Install cooling fan fasteners. Tighten to 12-36 in-lbs (1.4-4.1 Nm).

4. Install shock absorber. See 2.22 REAR SHOCK ABSORBER.

5. Connect negative battery cable.

Figure 4-83. Cooling Fan

Figure 4-84. Cooling Fan Connector [97]

WARNING

After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

6. Install seat. See 2.41 SEAT.
GENERAL
The fuel pump is located inside the left rear portion of the fuel tank/frame.

DRAINING FUEL TANK

WARNING
The gasoline in the fuel supply line downstream of the fuel pump is under high pressure (49 psi [338 kPa]). To avoid an uncontrolled discharge or spray of gasoline, always purge the system of high pressure gas before servicing fuel pump. Gasoline is extremely flammable and highly explosive. Inadequate safety precautions could result in death or serious injury.

1. Purge the fuel supply line of high pressure gasoline.
   a. See Figure 4-85. Disconnect the 4-place fuel pump connector (1) [86]. Connector is located inside the left rear portion of the fuel tank/frame.
   b. With the motorcycle in neutral, start the engine and allow vehicle to run.
   c. When the engine stalls, press the starter button for 3 seconds to remove any remaining fuel from fuel line.

WARNING
An open flame or spark may cause a fuel tank explosion if all traces of fuel are not purged from the tank. Use extreme caution when servicing fuel tanks. Gasoline is extremely flammable and highly explosive. Inadequate safety precautions could result in death or serious injury.

2. Remove drain plug (4) and drain fuel into appropriate container. Discard plug.

3. When fuel tank is empty, replace with new drain plug. Tighten to 84-108 in-lbs (9.5-12.2 Nm).
1. Remove rider footpeg mounts. See 2.30 FOOTPEG, HEEL GUARD AND MOUNT.
2. Remove swingarm. See 2.19 SWINGARM AND BRACE.
3. Drain fuel tank. See DRAINING FUEL TANK under 4.38 FUEL PUMP.

**WARNING**

A small amount of gasoline will drain from the fuel supply fitting, fuel line and fuel pump when removed. Thoroughly wipe up any spilt fuel immediately. Dispose of rags in a suitable manner. Gasoline is extremely flammable and highly explosive. Inadequate safety precautions could result in death or serious injury.

4. See Figure 4-85. Remove fuel line from fuel supply fitting (2).
5. Remove four fuel pump fasteners (5).
6. See Figure 4-86. Assemble fuel pump puller.
   a. Thread nut (3) onto bolt (4).
   b. Slide washer (2) onto bolt.
   c. Insert bolt assembly into hole in main body (1).
7. See Figure 4-87. Place the main body of the fuel pump puller over the fuel pump assembly.
8. Thread bolt into the threaded hole in the center of the fuel pump assembly until snug.
9. Thread the nut down the shaft of the bolt until it makes contact with the main body of the fuel pump puller.
10. Place wrench onto nut and another wrench onto the bolt. Hold the bolt stationary and turn nut clockwise until fuel pump is pulled free from frame.
Fuel Pressure Regulator Replacement
1. Remove fuel pump assembly from tank. See REMOVAL in this section.
2. See Figure 4-88. Pry four tabs of clip holding fuel pressure regulator (8) in place. Detach regulator from regulator housing.
3. Remove and discard O-rings from regulator.
4. Install new O-rings on regulator. Press new regulator into place.
5. Install new regulator clip.
6. Install fuel pump assembly. See INSTALLATION in this section.

Low Fuel Level Sensor Replacement
1. Remove fuel pump assembly from tank. See REMOVAL in this section.
2. See Figure 4-89. Disconnect low fuel level sensor connector (4).
3. Remove clamp (5) securing low fuel level sensor (6) in place.
4. Install new sensor.
5. Install new clamp over sensor.
6. Attach wire connector.
7. Install fuel pump assembly. See INSTALLATION in this section.

Fuel Filter Replacement
1. Remove fuel pump assembly from tank. See REMOVAL in this section.
2. See Figure 4-89. Remove fuel pump clamps (3, 7).
3. See Figure 4-90. Remove fuel pump clips (1).
4. Pull regulator housing (2) from fuel pump assembly.
5. See Figure 4-91. Discard regulator housing o-rings (2).
6. See Figure 4-89. Remove fuel filter hose from fitting (2) and remove fuel filter (1).
7. Install new clamps on fuel filter hose.
8. Install new fuel filter hose with 90° bend towards fitting (2).
9. See Figure 4-91. Install new regulator housing o-rings.
10. Install regulator housing onto fuel pump assembly.
11. See Figure 4-89. Tighten fuel filter clamps (3, 7).
12. See Figure 4-90. Install clips (1) into center grooves.
13. Install fuel pump assembly. See INSTALLATION in this section.
**Fuel Screen Replacement**

1. Remove fuel pump assembly from tank. See **REMOVAL** in this section.
2. See Figure 4-89. Remove fuel filter clamp (3). Disconnect hose from fitting (2).
3. See Figure 4-90. Remove clips (1).
4. See Figure 4-88. Disconnect fuel pump connectors (10) and low fuel level sensor connector (11).
5. Slide fuel pump and fuel filter off of fuel pump assembly.
6. Pry fuel screen (6) from fuel pump (7).

    **NOTE**
    
    In next step, make sure that section of screen with most material faces towards inside of fuel pump assembly.

7. Install **new** fuel screen on fuel pump.
8. Without damaging fuel screen, slide fuel pump onto fuel pump assembly.
9. See Figure 4-89. Attach fuel filter hose to fitting (2) with clamp (3).
10. See Figure 4-90. Install clips (1) into middle grooves.
11. See Figure 4-88. Connect low fuel level sensor wiring (11).
12. Connect fuel pump connectors (10). Connectors are two different sizes.
13. Install fuel pump assembly. See **INSTALLATION** in this section.

1. Clips
2. Regulator housing
3. Regulator

**Figure 4-91. Regulator Housing O-rings**

1. Clip grooves
2. O-rings
Fuel Pump Wire Harness Replacement

1. Remove fuel pump assembly from tank. See REMOVAL in this section.
2. See Figure 4-89. Remove fuel filter clamp (3). Disconnect hose from fitting (2).
3. See Figure 4-90. Remove fuel pump clips (1).
4. See Figure 4-88. Disconnect fuel pump connector (10) and low fuel level sensor connector (11).
5. Slide fuel pump and fuel filter off of fuel pump assembly.
6. Remove terminals from fuel pump connector [86].

NOTE
Note positions of wires in connector for correct assembly.

7. Disassemble fuel pump connector [86].
   a. See Figure 4-92. Remove connector clips (3).
   b. Insert push pin/safety pin (1), into connector as shown.
   c. Bend terminal tab towards connector pin and pull wire from opposite side of connector.
   d. Repeat for all wires.
8. See Figure 4-88. Remove screw (5).
9. See Figure 4-93. From outer side of fuel pump assembly, push wire harness through assembly.
10. Lubricate new o-rings with clean engine oil. From inner side of fuel pump assembly, push new wire harness into assembly.
11. See Figure 4-88. Insert new fastener (5), through ground wire terminal and secure to fuel pump assembly. Tighten to 18-22 in-lbs (2.0-2.5 Nm).

NOTE
After installing terminals, pull slightly on wire to make sure it is seated. If necessary, bend tab on terminal to aid in seating wire.

12. Install terminals into proper locations of fuel pump connector [86]. Install connector clips.
13. Without pinching fuel screen, slide fuel pump onto fuel pump assembly.
14. See Figure 4-89. Attach fuel filter hose to fitting (2) with clamp (3).
15. See Figure 4-90. Install clips (1) into middle grooves.
16. See Figure 4-88. Connect low fuel level sensor connector (11).
17. Connect fuel pump connectors (10). Connectors are two different sizes.
18. Install fuel pump assembly. See INSTALLATION in this section.
INSTALLATION

1. See Figure 4-88. Replace o-rings (4). Lubricate new o-rings with clean engine oil.
2. Install new o-rings on fuel supply stud (2). Larger o-ring is located in groove closer to fuel pump.
3. See Figure 4-94. Insert fuel pump into frame until resistance is felt.
4. Insert four screws (5) through fuel pump and into frame.

**CAUTION**

Use all four screws to draw fuel pump into frame. Using less than four screws will damage fuel pump o-rings.

5. Using crosswise pattern, draw fuel pump into frame by tightening screws. Final tighten screws to 48-51 in-lbs (5.4-5.8 Nm).

**WARNING**

Do NOT overtighten fuel fitting nuts. Overtightening fasteners may result in excessive compression of sealing components and fuel leakage which could result in death or serious injury.

6. Install fuel supply line banjo fitting (2) over fuel supply stud (3). Install new fastener. Tighten to 84-108 in-lbs (9.5-12.2 Nm).
7. Fill tank with a small amount of fuel. Check for leaks.
8. Connect fuel pump connector [86] (1) and push cable strap tab into hole in frame.
GENERAL

The vent valve opens to allow gas vapor to escape the fuel tank and either vent to the atmosphere or to the charcoal canister on California Models (EVAP-equipped) and closes to prevent gasoline from leaking out of the fuel tank if the vehicle is tipped at an extreme angle.

NOTE
The fuel tank must be drained to perform this service.

REMOVAL

1. Drain fuel tank. See DRAINING FUEL TANK under 4.38 FUEL PUMP.
2. Remove fuel tank vent line from vent valve.
3. See Figure 4-96. Remove vent valve fasteners (5).
4. Remove bracket (4), vent valve (3) and o-ring (2) from fuel tank/frame (1).

INSTALLATION

1. See Figure 4-96. Install new vent valve o-ring (2).
2. Install vent valve (3) into fuel tank/frame. Vent valve nozzle should be at approximately the 7:00 position.
3. Install bracket over vent valve. Slot in bracket should line up with notch in valve.
4. Loosely install vent valve fasteners (5).
5. Tighten fasteners to 39-41 in-lbs (4.4-4.6 Nm).
6. Connect fuel tank vent line to vent valve.
7. Install airbox. See 4.43 AIRBOX.
8. Install intake cover assembly. See 2.35 INTAKE COVER ASSEMBLY.
9. Connect negative battery cable. Tighten battery terminal hardware to 60-96 in-lbs (7-11 Nm).

WARNING
After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

10. Install seat. See 2.41 SEAT.
REMOVAL

NOTE
The fuel tank must be drained to perform this service.

1. Drain fuel tank. See DRAINING FUEL TANK under 4.38 FUEL PUMP.
2. Remove fuel filler cap.
3. See Figure 4-98. Remove fasteners (4) securing fuel cap retaining ring (3) to fuel filler neck (1).
4. Remove fuel cap retaining ring and o-ring (2). Discard o-ring.

INSTALLATION

1. Coat new o-ring (2) with thin film of clean engine oil.
2. Place o-ring into groove in underside of fuel cap retaining ring (3).

NOTE
Be sure o-ring remains in groove of fuel cap retaining ring during installation.

3. Insert fuel cap retaining ring into fuel filler neck.
4. Install fasteners (4). Tighten to 17-70 in-lbs (1.9-7.9 Nm).
5. Install fuel filler cap.
GENERAL

See Figure 4-100. The throttle body consists of the following components:

- Fuel supply fitting.
- Idle speed adjustment screw.
- Cable bracket.
- Throttle position sensor.
- Throttle lever.

REMOVAL

**WARNING**

The gasoline in the fuel supply line downstream of the fuel pump is under high pressure (49 psi [338 kPa]). To avoid an uncontrolled discharge or spray of gasoline, always purge the system of high pressure gas before servicing throttle body. Gasoline is extremely flammable and highly explosive. Inadequate safety precautions could result in death or serious injury.

1. Purge the fuel supply line of high pressure gasoline.
   a. See Figure 4-99. Disconnect the 4-place fuel pump connector [86]. Connector is located on the left side, above the fuel pump.
   b. With the motorcycle in neutral, start the engine and allow vehicle to run.
   c. When the engine stalls, press the starter button for 3 seconds to remove any remaining fuel from fuel line.
   d. Reconnect fuel pump connector.

2. Label and detach throttle cables. See 2.23 THROTTLE CONTROL.

3. See Figure 4-101. On California models, pull EVAP hose from fitting (1).

4. Rotate engine for service. See 3.3 ENGINE ROTATION FOR SERVICE.
1. Front fuel injector  
2. Rear fuel injector  
3. Fuel rail fastener (2)  
4. Fuel rail  
5. Throttle position sensor  
6. Throttle position sensor fastener (2)  
7. Washer  
8. Velocity stack  
9. Throttle body  
10. Velocity stack fastener (2)  
11. Ring seal  
12. Intake manifold  
13. Intake flange fastener (2)  
14. Intake flange (2)  
15. Intake seal (2)  
16. Intake flange fastener (2)
5. Remove assembly from motorcycle.
   a. See Figure 4-102. On primary cover side, loosen but do not remove the two front and rear intake flange fasteners (2).
   b. Remove fastener (1) holding manifold to engine mount.
   c. See Figure 4-103. On gearcase cover side, remove both intake flange fasteners from cylinder heads.
   d. Slide the throttle body and manifold assembly through top of bike frame.

6. See Figure 4-100. Remove intake flanges (14) from manifold. Remove and discard seals (15).

REPAIR

Throttle Position Sensor

See 4.36 THROTTLE POSITION SENSOR for removal, installation and calibration information.

Intake Manifold

1. See Figure 4-104. Remove upper fuel rail fastener (1).

2. See Figure 4-100. Separate intake manifold (12) from throttle body (9). Discard ring seal (11).

3. Install new ring seal on intake manifold.

4. Install intake manifold on throttle body.

5. See Figure 4-104. Apply a drop of LOCTITE 222 (purple) to threads of fuel rail fastener (1).

6. Install fastener. Tighten to 24-28 in-lbs (2.7-3.2 Nm).

Fuel Injectors

1. Remove throttle body. See REMOVAL in this section.

2. Separate fuel rail assembly from intake manifold.
   a. See Figure 4-104. Remove both injector clips (4).
   b. Remove fuel rail fasteners (1, 6) that hold the fuel rail to the throttle body and manifold.
   c. Separate fuel rail from injectors (2, 5) by gently rocking the fuel rail and pulling it away from the injectors.

3. Remove fuel injectors (2, 5) from manifold by gently rocking and pulling it away from the manifold.
WARNING

Do not use any injector that has damaged or deformed O-rings. Damaged O-rings may leak gasoline. Gasoline is extremely flammable and highly explosive. Use of damaged O-rings could result in death or serious injury.

4. Inspect all injector O-rings for cuts, tears or general deterioration. Replace injector if O-rings have been damaged or have taken a definite set.

5. Apply a thin coat of clean engine oil to top and bottom injector O-rings.

6. See Figure 4-104. Install fuel injectors.
   a. Install both injectors (2, 5) into intake manifold.
   b. Press the fuel rail assembly (3) onto the top of the injectors.
   c. Apply a drop of LOCTITE 222 (purple) to threads of fuel rail fasteners (1, 6).
   d. Secure the fuel rail to the throttle body and manifold with fasteners. Tighten to 24-28 in-lbs (2.7-3.2 Nm).

7. Snap the injector clips (4) over the flange on the fuel rail outlet and into the top groove in the injector.

Testing

1. Remove intake cover assembly. See 2.35 INTAKE COVER ASSEMBLY.

2. Remove airbox cover. See 4.43 AIRBOX.

3. Conduct test.
   a. Turn key ON for two seconds.
   b. Turn key OFF for two seconds.
   c. Repeat Steps A and B five consecutive times.
   d. Open throttle, replace fuel injectors if there is any evidence of raw fuel in throttle body manifold.

4. Install airbox cover. See 4.43 AIRBOX.

5. Install intake cover assembly. See 2.35 INTAKE COVER ASSEMBLY.
INSTALLATION

1. See Figure 4-105. Install front and rear intake flanges onto manifold with the counterbore facing out. Each intake flange is labeled and the pieces are not interchangeable.

2. Place a new seal in each intake flange with the beveled side against the counterbore.

3. Install throttle body/intake manifold assembly.
   a. See Figure 4-102. Slide the assembly toward installed position. Manifold should slide over fasteners (2) on primary cover side of engine.
   b. Align holes in intake flanges with those in cylinder heads and start screws.
   c. Make sure throttle body is centered between cylinders and tighten all intake flange screws to 96-120 in-lbs (10.8-13.6 Nm).

4. Rotate engine into installed position. See 3.3 ENGINE ROTATION FOR SERVICE.

5. Attach throttle cables. See 2.23 THROTTLE CONTROL.

6. Attach wiring.
   a. Injector cables are tagged F(ront) and R(ear) for ease of assembly. Push connector halves together until latches “click.” Grooves in female connector must align with the tabs in male housing.
   b. Connect throttle position sensor by pushing the connector halves together. Slots on female connector must fully engage tabs on male connector housing.

7. Connect EVAP hose to port at bottom of throttle body (California models only).

8. Calibrate throttle position sensor if removed or replaced. See 4.36 THROTTLE POSITION SENSOR.

9. Install airbox. See 4.43 AIRBOX.

10. Check throttle cable adjustment. See 2.23 THROTTLE CONTROL.
GENERAL

**DANGER**

Propane is an extremely flammable liquid and vapor. Vapor may cause flash fire. Keep away from heat, sparks and flame. Keep container closed. Use only with adequate ventilation.

**WARNING**

Read all directions and warnings on propane bottle. Failure to follow all directions and warnings on bottle could result in death or serious injury.

- To prevent false readings, keep airbox cover installed when performing test.
- Do not direct propane into air scoop, false readings will result.

LEAK TESTER

Parts List

- Standard 14 oz. propane cylinder.
- SNAP-ON YA7148 Propane Enrichment Kit.
- 12 in. (304 mm) long-1/4 in. (6mm) diameter copper tubing.

Tester Assembly

1. Cut rubber hose from kit to 18 in. (457 mm) in length.
2. See Figure 4-106. Flatten one end of copper tube to form a nozzle.
3. Insert round side of copper tube into end of tubing.
INTAKE LEAK TEST

1. Start engine.
2. Warm engine to operating temperature.
3. See Figure 4-107. Turn knob (5) counterclockwise to open propane bottle (6).

**DANGER**

Propane is an extremely flammable liquid and vapor. Vapor may cause flash fire. Keep away from heat, sparks and flame. Keep container closed. Use only with adequate ventilation.

**NOTE**

Do not direct propane stream toward front of engine. If propane enters air scoop a false reading will be obtained.

4. See Figure 4-108. Aim nozzle toward possible sources of leak such as fuel injectors and intake tract.
5. See Figure 4-107. Push valve (4) to release propane. Tone of engine will change when propane enters source of leak.
REMOVAL

1. Remove intake cover assembly. 2.35 INTAKE COVER ASSEMBLY.

2. See Figure 4-109. Remove fuel vent tube (3) from fuel cell vent (4) and groove on top of airbox cover (2).

3. Unlatch six lock tabs (1) and remove airbox cover from baseplate.

4. Remove the filter element from baseplate. Inspect and replace if necessary.

5. See Figure 4-110. Remove air cleaner baseplate.
   a. Remove four fasteners (1) and raise baseplate (4).
   b. Disconnect longer breather hose from baseplate (pull out from bottom).
   c. Disconnect shorter breather hose from PVC valve located on top of rear cylinder.
   d. Disconnect IAT sensor [89] from bottom of baseplate.
   e. Lift baseplate off of frame, carefully disengaging baseplate from rubber sealing ring (8) on velocity stack (7).
   f. Remove baseplate from motorcycle.

INSPECTION

1. Inspect air cleaner. Check for dirt, torn filter material and general condition. Replace if necessary.

2. Inspect inside of backing plate and cover. Remove any dirt or debris.

3. Inspect condition of velocity stack and velocity stack sealing ring. If torn or damaged, replace.

4. Inspect IAT sensor and replace if faulty. See 4.35 INTAKE AIR TEMPERATURE SENSOR.

5. Inspect breather hoses, intake air temperature sensor grommet and baseplate gasket (3). Replace as necessary.
**INSTALLATION**

1. See Figure 4-111. Hold baseplate above mounting position.
2. Insert IAT sensor into grommet on baseplate from underside.

**NOTE**
A small amount of soapy water applied to the inside diameter of grommet will make breather hose installation easier.

**CAUTION**
In next step, be sure breather hoses do not extend past intake air temperature sensor tower. If hoses extend past tower, damage to sensor may occur.
3. Insert longer breather hose into right baseplate grommet from underside.
4. Attach shorter breather hose onto crankcase breather located on top of rear cylinder.
5. Carefully lower baseplate into mounting position. Ensure rubber sealing ring on velocity stack completely engages baseplate. Baseplate should be sandwiched between upper and lower rubber sealing rings.
6. Install baseplate to frame with four fasteners and washers (5). Tighten fasteners to 84-120 in-lbs (9.5-13.6 Nm).
7. Position air cleaner filter on baseplate.
8. Install airbox to baseplate and latch six latches to secure.
9. Route vent hose through groove on airbox to vent valve.
10. Install intake cover assembly. See 2.35 INTAKE COVER ASSEMBLY.

**WARNING**
After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.
11. Install seat. See 2.41 SEAT.

GENERAL

Buell motorcycles sold in the state of California are equipped with an evaporative (EVAP) emissions control system. The EVAP system prevents fuel hydrocarbon vapors from escaping into the atmosphere and is designed to meet the California Air Resource Board (CARB) regulations in effect at the time of manufacture.

The EVAP functions in the following manner:

- Hydrocarbon vapors in the fuel tank are directed through the vent valve and stored in the carbon canister. If the vehicle is tipped at an abnormal angle, the vent valve closes to prevent liquid gasoline from leaking out of the fuel tank through the fuel tank vent hose.

- When the engine is running, manifold venturi negative pressure (vacuum) slowly draws off the hydrocarbon vapors from the carbon canister through the canister vent hose. These vapors pass through the throttle body manifold and are burned as part of normal combustion in the engine.

TROUBLESHOOTING

WARNING

Verify that the evaporative emissions system hoses do not contact hot exhaust or engine parts. The hoses contain flammable vapors that can be ignited if damaged, which could result in death or serious injury.

The system has been designed to operate with a minimum of maintenance. Check that all hoses are properly routed and connected and are not pinched or kinked.

REMOVAL

VENT VALVE

1. Remove vent valve. See 4.39 FUEL TANK VENT VALVE.
2. If necessary, label fuel tank vent hose at canister fitting and remove.

CANISTER

1. See Figure 4-112. Label and disconnect the fuel tank vent hose (2) and canister vent hose (3) from the canister.
2. Slide canister towards rear of vehicle to disengage from mounting plate.
VENT VALVE

WARNING
Verify that the fuel tank vent hose does not contact hot exhaust or engine parts. The hose contains flammable vapors that can be ignited if damaged, which could result in death or serious injury.

1. Install vent valve. See 4.39 FUEL TANK VENT VALVE.
2. See Figure 4-112. Attach fuel tank vent hose (2) to canister if disconnected.

CANISTER

NOTE
In next step, be sure canister hose barbs are facing rear of vehicle at approximately the 1 o'clock position.

1. See Figure 4-114. Slide canister into position on canister mounting plate and push towards front of vehicle.

WARNING
Always make sure fuel hoses are seated against the component they connect to and that hose clamps are properly tightened and positioned on straight section of fitting and not on the fitting barb. Failure to comply may result in fuel leakage which could result in death or serious injury.

NOTE
The barb is the larger outside diameter portion (bump) on the fuel fitting.

2. See Figure 4-112. Connect two hoses to the canister. Make sure to push hoses all the way on to carbon canister fittings.

---

Figure 4-113. Airbox Cover

Figure 4-114. Canister Mounting Bracket
Both fuel tank and canister vent hoses are routed through notch in fan body.

**NOTE**
For information on vent hose routing, see D.1 HOSE AND WIRE ROUTING.

**WARNING**
Always make sure fuel hoses are seated against the component they connect to and that hose clamps are properly tightened and positioned on straight section of fitting and not on the fitting barb. Failure to comply may result in fuel leakage which could result in death or serious injury.

GENERAL

The starter is made up of an armature, field winding assembly, solenoid, drive assembly, idler gear and drive housing.

The starter motor torque is increased through gear reduction. The gear reduction consists of the drive pinion on the armature, an idler gear and a clutch gear in the drive housing. The idler gear is supported by rollers. The clutch gear is part of the overrunning clutch/drive assembly.

The overrunning clutch is the part which engages and drives the clutch ring gear. It also prevents the starter from overrunning. The field windings are connected in series with the armature through brushes and commutator segments.

Wiring Diagrams

For additional information concerning the starting system circuit, see the wiring diagram at the end of Section 7, ELECTRICAL.

Starter Relay

The starter relay is not repairable. Replace the unit if it fails.

Starter Interlock

See 7.5 STARTER INTERLOCK for operation and troubleshooting information.

OPERATION

See Figure 5-1. When the starter switch is pushed, the starter relay is activated and battery current flows into the pull-in winding (10) and the hold-in winding (11), to ground.

The magnetic forces of the pull-in and hold-in windings in the solenoid push the plunger (7) causing it to shift to the left. This action engages the pinion gear (1) with the clutch ring gear (13). At the same time, the main solenoid contacts (8) are closed, so battery current flows directly through the field windings (3) to the armature (4) and to ground. Simultaneously, the pull-in winding (10) is shorted.

The current continues flowing through the hold-in winding (11) keeping the main solenoid contacts (8) closed. At this point, the starter begins to crank the engine.

After the engine has started, the pinion gear (1) turns freely on the pinion shaft through the action of the overrunning clutch (12). The overrunning clutch prevents the clutch ring gear (13) (which is now rotating under power from the engine) from turning the armature (4) too fast.

When the starter switch is released, the current of the hold-in winding (11) is fed through the main solenoid contacts (8) and the direction of the current in the pull-in winding (10) is reversed. The solenoid plunger (7) is returned to its original position by the return spring, which causes the pinion gear (1) to disengage from the clutch ring gear (13).

DIAGNOSTICS

Diagnostic Notes

The reference numbers below correlate with the circled numbers on the starter system flow charts.

1. See VOLTAGE DROPS under 5.5 DIAGNOSTICS/TROUBLESHOOTING.
2. Remove starter motor and connect jumper wires as described in FREE RUNNING CURRENT DRAW TEST under 5.7 STARTER.
3. Take measurement with connector mated.
4. See DIAGNOSTICS in 7.5 STARTER INTERLOCK.
5. See STARTER CURRENT DRAW TEST under 5.6 STARTER SYSTEM TESTING.
6. See FREE RUNNING CURRENT DRAW TEST.

Starter Test 1

[Diagram of starter system flow chart]

- Check battery using visual inspection, voltage test and load test.
- Check connections at battery and starter components. Is system operational?

If YES: STARTER RUNS ON.

- Disconnect solenoid relay terminal from solenoid. Is 12V present on GN wire with starter button not pressed?
  - NO: Replace starter relay.

If NO: STARTER SPINS, BUT DOES NOT ENGAGE.

- See Starter Test 6: Starter Stalls or Spins Too Slowly.

If YES: STARTER STALLS OR SPINS TOO SLOWLY.

- Solenoid clicks. See Starter Test 2: Solenoid Clicks.

If NO: Check for audible clicking noise.

- Relay clicks. See Starter Test 3: Relay Clicks.

If OR: Nothing clicks. See Starter Test 4: Nothing Clicks.
Sca STARTER Test 2: Solenoid Clicks

1. Perform voltage drop tests from battery positive to starter motor terminal. Crank engine. Voltage greater than 1 volt?
   - YES
   - NO
   1. Perform voltage drop tests from battery positive to starter battery terminal. Crank engine. Voltage greater than 1 volt?
      - YES
      - NO
      1. Perform voltage drop tests between battery negative and starter studs or bolts. Voltage greater than 1 volt?
         - NO
         Backtrack to pinpoint poor connections or relay contact problems using voltage drop tests.
      1. Perform voltage drop tests between battery and relay terminal on solenoid. Less than 1.0 volt?
         - YES
         - NO
      1. Backtrack to pinpoint poor connections or relay contact problems using voltage drop tests.
   1. Perform voltage drop tests from battery positive to starter motor terminal. Crank engine. Voltage greater than 1 volt?
      - YES
      - NO
   1. Perform voltage drop tests from battery positive to starter battery terminal. Crank engine. Voltage greater than 1 volt?
      - YES
      - NO
   1. Perform voltage drop tests between battery negative and starter studs or bolts. Voltage greater than 1 volt?
      - NO
      - YES
      Backtrack to pinpoint poor connections or relay contact problems using voltage drop tests.

Sca STARTER Test 3: Relay Clicks

1. Test for voltage at solenoid relay terminal on starter. Is 12V present when starter button is pressed?
   - YES
   - NO
   2. Does starter motor turn if jumped?
      - YES
      - NO
      2. Test for voltage to relay. Is 12V present on relay terminal 30?
         - YES
         - NO
   2. Repair or replace solenoid (contacts). Clean ground connections.
      - YES
      - NO
   2. Repair or replace solenoid (contacts). Clean ground connections.

      - YES
      - NO
   2. Repair or replace solenoid (contacts). Clean ground connections.
      - YES
Starter Test 4: Nothing Clicks

Check for battery voltage at starter relay Terminal 86 from starter button. Battery voltage present?

YES

Check for ground at relay Terminal 85. Ground present?

YES

Substitute good starter relay or test relay.

NO

NO

Check for battery voltage from starter button (BK/R wire at connector [22]). Battery voltage present with starter button pressed?

YES

Inspect Starter Interlock Circuit or Correct Relay Ground.

NO

Repair wiring from starter button to relay.

Repair wiring to starter button.

Replace right handlebar switchgear.

Replace right handlebar switchgear.
Starter Test 5: Starter Spins, But Does Not Engage

Remove starter. Disassemble drive housing assembly. Inspect for damage to armature gear or idler gear. Damage present?

- **YES**
  - Replace damaged idler gear and armature.
  - Damage present?
  - **YES**
    - Replace damaged idler gear and armature.
  - **NO**
    - Starter clutch failure. Replace starter clutch.

**Starter Test 6: Starter Stalls or Spins Too Slowly**

1. Perform voltage drop tests between battery positive to starter motor terminal. Crank engine. Voltage greater than 1 volt?

   - **YES**
   - Perform voltage drop tests between battery positive to starter battery terminal. Crank engine. Voltage greater than 1 volt?
     - **YES**
       - Repair connection between battery and starter.
     - **NO**
       - Repair or replace solenoid (contacts).

   - **NO**
     - Perform voltage drop tests between battery negative and starter studs or bolts. Voltage greater than 1 volt?
       - **YES**
         - Clean ground connections.
       - **NO**
         - Perform starter motor current draw test (on vehicle).

   - Use appropriate code

   - **4**
     - Perform starter motor free draw bench test.
     - Are test results within range?
     - **YES**
       - Remove spark plugs while in 5th gear. Rotate rear wheel. Check for engine, primary and/or crankshaft bind.
     - **NO**
       - Test starter motor for opens, shorts or grounds. Replace or repair starter motor.

GENERAL

Follow the 5.3 STARTING SYSTEM DIAGNOSIS diagram to diagnose starting system problems. The VOLTAGE DROPS procedure below will help you to locate poor connections or components with excessive voltage drops.

VOLTAGE DROPS

Check the integrity of all wiring, switches, fuses and connectors between the source and destination.

The voltage drop test measures the difference in potential or the actual voltage dropped between the source and destination.

1. See ITEM A in Figure 5-3. Attach your red meter lead to the most positive part of the circuit, which in this case would be the positive post of the battery (1).
2. See ITEM B in Figure 5-3. Attach the black meter lead to the final destination or component in the circuit (solenoid terminal from relay).
3. Activate the starter and observe the meter reading. The meter will read the voltage dropped or the difference in potential between the source and destination.
4. An ideal circuit's voltage drop would be 0 volts or no voltage dropped, meaning no difference in potential.
5. See ITEM C in Figure 5-3. An open circuit should read 12 volts, displaying all the voltage dropped, and the entire difference in potential displayed on the meter.
6. Typically, a good circuit will drop less than 1 volt.
7. If the voltage drop is greater, back track through the connections until the source of the potential difference is found. The benefit of doing it this way is speed.
   a. Readings aren’t as sensitive to real battery voltage.
   b. Readings show the actual voltage dropped, not just the presence of voltage.
   c. This tests the system as it is actually being used. It is more accurate and will display hard to find poor connections.
   d. This approach can be used on lighting circuits, ignition circuits, etc. Start from most positive and go to most negative (the destination or component).
8. See ITEM D in Figure 5-3. The negative or ground circuit can be checked as well.
   a. Place the negative lead on the most negative part of the circuit (or the negative battery post). Remember, there is nothing more negative than the negative post of the battery.
   b. Place the positive lead to the ground you wish to check.
   c. Activate the circuit. This will allow you to read the potential difference or voltage dropped on the negative or ground circuit. This technique is very effective for identifying poor grounds due to powdered paint. Even the slightest connection may cause an ohmmeter to give a good reading. However, when sufficient current is passed through, the resistance caused by the powdered paint will cause a voltage drop or potential difference in the ground circuit.
Figure 5-4. Electric Starting System Circuit
“ON-MOTORCYCLE” TESTS

Starter Relay Test

NOTE
Starter relay test also applies to ignition and key switch relays.

1. See Figure 5-5. Locate starter relay. The relay is attached to the relay block under the seat.
2. To test relay, proceed to Step 3. If installing a new starter relay, remove old relay. Install new relay into relay block.
3. See Figure 5-6. Obtain a 12 volt battery and a continuity tester or ohmmeter.
   a. Pull relay from relay block.
   b. Connect positive battery lead to the 1 terminal.
   c. Connect negative battery lead to the 2 terminal to energize relay.
   d. Check for continuity between the 3 and 5 terminals. A good relay shows continuity (continuity tester lamp “on” or a zero ohm reading on the ohmmeter). A malfunctioning relay will not show continuity and must be replaced.
4. If starter relay is functioning properly, proceed to STARTER CURRENT DRAW TEST.

Starter Current Draw Test

NOTES

- Engine temperature should be stable and at room temperature.
- Battery should be fully charged.

See Figure 5-7. Check starter current draw with an induction ammeter before disconnecting battery. Proceed as follows:

1. Verify that transmission is in neutral. Disconnect spark plug wires from spark plug terminals.
2. Clamp induction ammeter over positive battery cable next to starter.
3. With ignition key switch ON, turn engine over by pressing starter switch while taking a reading on the ammeter. Disregard initial high current reading which is normal when engine is first turned over.
   a. Typical starter current draw will range between 140-180 amperes.
   b. If starter current draw exceeds 180 amperes, then the problem may be in the starter or starter drive. Remove starter for further tests. See 5.7 STARTER.
REMOVAL

1. Remove seat. See 2.41 SEAT.

**WARNING**

Always disconnect the negative battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

2. Disconnect battery. See 1.5 BATTERY MAINTENANCE.

3. Remove primary cover. See PRIMARY COVER under 6.2 PRIMARY CHAIN.

4. Remove sprocket cover. See 2.31 SPROCKET COVER.

**NOTE**

A ball hex driver may be required to gain access to the starter mounting bolts.

5. See Figure 5-8. Remove two starter mounting bolts and washers (1).

6. See Figure 5-9. Remove fastener with washer (1) (metric).
   a. Remove protective boot.
   b. Remove positive battery cable ring terminal (2).
   c. Detach solenoid wire (3).

7. Remove starter and gasket from the gearcase cover side.

Figure 5-8. Starter Mounting

Figure 5-9. Starter Wires (Protective Boot Not Shown)
TESTING ASSEMBLED STARTER

Free Running Current Draw Test
1. Place starter in vise, using a clean shop towel to prevent scratches or other damage.
2. See Figure 5-10. Attach one heavy jumper cable (6 gauge minimum).
   a. To the starter mounting flange (1).
   b. To the negative (-) terminal of a fully charged battery.
3. Connect a second heavy jumper cable (6 gauge minimum).
   a. To the positive (+) terminal of the battery (2).
   b. To an inductive ammeter (3). Continue on to the battery terminal (4) on the starter solenoid.
4. Connect a smaller jumper cable (14 gauge minimum).
   a. To the positive (+) terminal of the battery (2).
   b. To the solenoid relay terminal (5).
5. Check ammeter reading.
   a. Ammeter should show 90 amps maximum.
   b. If reading is higher, disassemble starter for inspection. See 5.7 STARTER.
   c. If starter current draw on vehicle was over 200 amps and this test was within specification, there may be a problem with engine or primary drive.

Starter Solenoid

NOTE
Do not disassemble solenoid. Before testing, disconnect field wire from motor terminal as shown in Figure 5-11.

CAUTION
Each test should be performed for only 3-5 seconds to prevent damage to solenoid.

NOTE
The solenoid Pull-in, Hold-in, and Return tests must be performed together in one continuous operation. Conduct all three tests one after the other in the sequence given without interruption.

Solenoid Pull-in Test
1. See Figure 5-11. Using a 12 volt battery, connect three separate test leads as follows:
   a. Solenoid housing to negative battery post.
   b. Solenoid motor terminal to negative battery post.
   c. Solenoid relay terminal to positive battery post.
2. Observe starter pinion.
   a. If starter pinion pulls in strongly, solenoid is working properly.
   b. If starter pinion does not pull in, replace the solenoid.
**Solenoid Hold-in Test**

1. See Figure 5-12. With test leads still connected in the manner specified in the previous **Solenoid Pull-in Test**, disconnect solenoid motor terminal/battery negative test lead (B) at negative battery post only; reconnect loose end of this test lead to positive battery post instead.

2. Observe starter pinion.
   a. If starter pinion remains in pull-in position, solenoid is working properly.
   b. If starter pinion does not remain in pull-in position, replace the solenoid.

**Solenoid Return Test**

1. See Figure 5-13. With test leads still connected in the manner specified at the end of the previous **Solenoid Hold-in Test**, disconnect solenoid relay terminal/positive battery post test lead (C) at either end.

2. Observe starter pinion.
   a. If starter pinion returns to its original position, solenoid is working properly.
   b. If starter pinion does not return to its original position, replace the solenoid.
DISASSEMBLY, INSPECTION AND REPAIR

1. See Figure 5-14. Lift rubber boot (1). Remove field wire nut with washer (2) (metric) to detach field wire (3).
2. See Figure 5-15. Remove both thru-bolts (1, 3).
3. Remove both end cover screws with O-rings (2) and end cover (4).
4. See Figure 5-16. Use a wire hook to pull upward on brush springs (3), and lift brushes out of holder (2). Remove brush holder.
5. Check brush length. Replace all four brushes if length of any one brush is less than 0.433 in. (11.0 mm).

NOTE

Brushes not available separately. Purchase a new field frame (1) and brush holder (2) to replace brushes.

6. Remove armature (4) and field frame (1).

7. Place armature in lathe or truing stand and check commutator runout and diameter.
   a. Commutators with more than 0.016 in. (0.406 mm) of runout should be replaced or machined on a lathe.
   b. Replace commutators when diameter is less than 1.141 in. (28.981 mm)
   c. Check armature bearings. Replace if necessary.

CAUTION

Do not use sandpaper or emery cloth to remove burrs on commutator. Otherwise, abrasive grit may remain on commutator segments; this could lead to excessive brush wear. Use only the recommended crocus cloth.

NOTE

See Figure 5-17. If an undercutting machine is not available, undercutting can be done satisfactorily using a thin hacksaw blade. After undercutting, lightly sand the commutator with crocus cloth to remove any burrs.

8. Check depth of mica on commutator. If undercut is less than 0.008 in. (0.203 mm), use an undercutting machine to undercut the mica to 1/32 in. (0.794 mm) deep. The slots should then be cleaned to remove any dirt or copper dust.
Figure 5-17. Undercutting Mica Separators

Mica must not be left with a thin edge next to segments.

Mica must be cut away clean between segments.
9. See Figure 5-18. Check for SHORTED ARMATURE with a growler.
   a. Place armature on growler (1).
   b. Hold a thin steel strip (2) (hacksaw blade) against armature core and slowly turn armature.
   c. A shorted armature will cause the steel strip to vibrate and be attracted to the core. Replace shorted armatures.

10. See Figure 5-19. Check for a GROUNDED ARMATURE with an ohmmeter or continuity tester.
    a. Touch one probe to any commutator segment (1).
    b. Touch the other probe to the armature core (2).
    c. There should be no continuity (infinite ohms). If there is continuity, then the armature is grounded. Replace grounded armatures.

11. See Figure 5-20. Check for OPEN ARMATURE with an ohmmeter or continuity tester.
    a. Check for continuity between all commutator segments (1).
    b. There should be continuity (0 ohms) at all test points. No continuity at any test point indicates armature is open and must be replaced.
12. See Figure 5-21. Check for GROUNDED FIELD COIL with an ohmmeter or continuity tester.
   a. Touch one probe to the frame (1).
   b. Touch the other probe to each of the brushes (2) attached to the field coil.
   c. There should be no continuity (infinite ohms). If there is any continuity at either brush, then the field coil(s) are grounded and the field frame must be replaced.

13. See Figure 5-22. Check for OPEN FIELD COILS with an ohmmeter or continuity tester.
   a. Touch one probe to the field wire (1).
   b. Touch the other probe to each of the brushes attached to the field coil(s) (2).
   c. There should be continuity (0 ohms). If there is no continuity at either brush, then the field coil(s) are open and the field frame must be replaced.

14. See Figure 5-23. Test BRUSH HOLDER INSULATION with an ohmmeter or continuity tester.
   a. Touch one probe to holder plate (1).
   b. Touch the other probe to each of the positive (insulated) brush holders (2).
   c. There should be no continuity (infinite ohms). If there is continuity at either brush holder, replace the brush holder assembly.

15. See Figure 5-24. Remove two drive housing mounting screws (6). Remove drive housing (5) from solenoid housing.

16. Remove drive (1), idler gear (2), idler gear bearing (3), and O-ring (4) from drive housing (O-ring is located in drive housing groove).
ASSEMBLY

1. See Figure 5-24. Clean, inspect and lubricate drive assembly components. Lubricate parts with high temperature grease, such as LUBRIPLATE 110.

2. See Figure 5-27. When installing drive assembly components, open end of idler bearing cage (15) faces toward solenoid.

3. When installing drive housing (10) to solenoid housing (11), use new O-ring (16). Be sure to install return spring (17) and ball (18).

4. Lubricate armature bearings (8) with high temperature grease, such as LUBRIPLATE 110. Install armature (6) and field frame (7) to solenoid housing (11).

5. Install brushes and brush holder (4).

6. Install O-rings (23). Attach end cover (3) with end cover screws and O-rings (2).

7. Install thru-bolts (1).

8. Attach field wire (22) to solenoid housing (11) with field wire nut and washer (24) (metric). Replace rubber boot.

INSTALLATION

1. Install starter and starter gasket from the gearcase cover side.

2. See Figure 5-25. Connect wiring to starter.
   a. Connect solenoid wire (3).
   b. Attach positive battery cable ring terminal (2) to stud with fastener and washer.
   c. Install nut and washer (1) (metric). Tighten nut to 60-85 in-lbs (7-10 Nm).
   d. Replace protective boot.

3. See Figure 5-26. Install both starter mounting bolts and washers. Tighten to 13-20 ft-lbs (18-27 Nm).

4. Install sprocket cover. See 2.31 SPROCKET COVER.

5. Install primary cover. See PRIMARY COVER under 6.2 PRIMARY CHAIN.

WARNING

Always connect the positive battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

6. Install positive battery cable (red) to positive terminal of battery. Tighten to 72-96 in-lbs (8-11 Nm).

7. Connect negative battery cable. Tighten to 72-96 in-lbs (8-11 Nm).

WARNING

After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

8. Install seat. See 2.41 SEAT.

Figure 5-27. Starter Assembly
GENERAL

CAUTION

See Figure 5-28. Do not tighten nut (7) without removing items (1) through (5). Movement will cause damage to the contact.

The starter solenoid is a switch that is designed to open and close the starting circuit electromagnetically. The switch consists of contacts and a winding around a hollow cylinder containing a movable plunger.

DISASSEMBLY

1. See Figure 5-28. Remove screws (1) and clip (2).
2. Remove cover (3) and gasket (4). Discard gasket.
3. Remove plunger (5) from solenoid housing (6).

ASSEMBLY

1. See Figure 5-28. Replace wire connection hardware as necessary.
2. Install plunger (5) in solenoid housing (6).
3. Install new gasket (4) onto cover (3).
4. Position cover with gasket onto solenoid housing. Install clip (2) and screws (1).

GENERAL

An opening between the primary drive and transmission compartments allows the same lubricant supply to lubricate moving parts in both areas.

Since the primary chain runs in lubricant, little service will be required other than checking lubricant level and chain tension. If, through hard usage, the primary chain does become worn, it must be replaced. Remove and install the chain following the procedure under 6.4 PRIMARY DRIVE/GLUTCH.

23. O-ring
24. Drain plug
Primary Cover

1. Remove seat. See 2.41 SEAT.

**WARNING**

To protect against shock and accidental start-up of vehicle, disconnect the negative battery cable before proceeding. Inadequate safety precautions could result in death or serious injury.

2. Disconnect negative battery cable from battery.
3. Remove chin fairing. See 2.34 CHIN FAIRING.

4. See Figure 6-2. Place a drain pan under the engine/primary area. Remove drain plug (4) and drain lubricant from primary drive.

5. Remove shifter lever assembly and rubber washer. Do not scratch primary cover.

**NOTE**

It is recommended that the shifter shaft seal be replaced whenever the primary cover is removed.

6. Add freeplay to clutch cable. See ADJUSTMENT under 1.9 CLUTCH.

7. See Figure 6-2. Loosen locknut (6). Turn chain adjuster screw (5) counterclockwise to remove tension on primary chain.

8. Remove three TORX screws with washers and clutch inspection cover.

9. See Figure 6-2. Remove clutch inspection cover (3).

10. See Figure 6-3. Remove the outer ramp and hook (1) from the cable end (3) and coupling (2). Remove cable end from slot in coupling. See 6.3 CLUTCH RELEASE MECHANISM

11. Remove screws which secure primary cover. Remove cover and gasket.

12. Discard gasket.

13. Remove and discard shifter lever oil seal.

14. Clean all parts in a non-volatile cleaning solution or solvent.

**WARNING**

Low pressure compressed air can blow debris into your face and eyes. Always wear eye protection or a face shield when using pressurized air. Failure to take adequate safety precautions could result in death or serious injury.

15. Blow parts dry with low pressure compressed air.
Primary Chain Adjuster Inspection & Replacement

NOTE
The primary chain adjuster shoe should be inspected and measured for wear every 10,000 miles (16,000 km).

1. See Figure 6-4. Remove chain adjusting nut from the chain limiting screw.
2. Turn the chain limiting screw clockwise until it can be removed from the inside of the primary cover along with the chain adjuster shoe.

Figure 6-4. Primary Chain Adjuster

1. Shoe, chain adjuster
2. Chain limiting screw
3. Chain adjusting nut

NOTE
See Figure 6-5. When measuring the shoe for wear it is necessary to measure from the top surface of the shoe to the bottom of the chain groove. If the measurement in any one of the four locations exceeds the listed specifications, the shoe should be replaced.

3. See Figure 6-4. Thread chain limiting screw (2), counterclockwise, down through the bottom of the outer primary cover, on the inside, until it bottoms out.
4. Install the chain adjusting nut (3) but do not lock down.
5. Install primary cover. See Primary Cover in 6.2 PRIMARY CHAIN.

Figure 6-5. Measuring Chain Adjuster Shoe

1. .040
2. .0625
3. .0625
4. .040
Primary Cover

1. Remove foreign material from magnetic drain plug. Install plug and tighten to 14-30 ft-lbs (19-54 Nm).
2. Wipe gasket surface clean. Install new gasket on primary cover.
3. Install primary cover and gasket onto left crankcase half using mounting bolts.

4. See Figure 6-6. Tighten bolts to 80-110 in-lbs (9-12.4 Nm) in sequence shown.
5. See Figure 6-1. Install new shifter lever oil seal.

6. See Figure 6-7. Fit coupling (2) over cable end (1) with rounded side inboard and the ramp connector button outboard. With retaining ring side of ramp assembly facing inward, place hook of ramp (3) around coupling button and rotate assembly counterclockwise until tang on inner ramp fits in slot of primary cover.
7. Thread nut on adjustment screw until slot of screw is accessible with a screwdriver. Fit nut hex into recess of outer ramp and turn adjustment screw counterclockwise.
8. Adjust clutch. See ADJUSTMENT under 1.9 CLUTCH.
9. Adjust primary chain tension. See 1.11 PRIMARY CHAIN.
10. Fill transmission to proper level with fresh lubricant. See 1.9 CLUTCH.
DISASSEMBLY

NOTE
For clutch adjustment procedure, See 1.9 CLUTCH.

1. Remove seat. See 2.41 SEAT.

WARNING
To protect against shock and accidental start-up of vehicle, disconnect the negative battery cable before proceeding. Inadequate safety precautions could result in death or serious injury.

2. Disconnect negative battery cable.
3. Slide rubber boot on clutch cable adjuster upward to expose adjuster mechanism. Loosen jam nut from adjuster. Turn adjuster to shorten cable housing until there is a large amount of freeplay at clutch hand lever. See 1.9 CLUTCH.

4. See Figure 6-9. Remove three TORX screws with washers and clutch inspection cover.
5. Slide spring (4) with attached screw lockplate (5) from flats of adjusting screw.
6. Turn adjusting screw clockwise to release ramp and coupling mechanism (7). As the adjusting screw is turned, ramp assembly moves forward. Unscrew nut (6) from end of adjusting screw.
7. Remove hook of ramp from cable end coupling (10). Remove cable end from slot in coupling.
8. Remove and discard retaining ring from ramp assembly to separate inner and outer halves. Remove three balls from ramp sockets.

CLEANING AND INSPECTION

1. Thoroughly clean all parts in cleaning solvent.
2. See Figure 6-9. Inspect three balls of release mechanism and ball socket surfaces of inner and outer ramps for wear, pitting, surface breakdown and other damage. Replace parts as necessary.
3. Check hub fit of inner and outer ramps. Replace ramps if excessively worn.
4. Check clutch cable for frayed or worn ends. Replace cable if damaged or worn.
5. Change or add transmission fluid if necessary. See 1.9 CLUTCH.

Figure 6-9. Clutch Release Mechanism
ASSEMBLY

1. See Figure 6-10. Assemble inner and outer ramps.
   a. Apply multi-purpose grease to balls and ramps.
   b. Insert balls in sockets of outer ramp.
   c. Install inner ramp on hub of outer ramp with tang 180° from hook of outer ramp.
   d. Install new retaining ring in groove of outer ramp hub.
2. See Figure 6-11. Install ramp assembly.
   a. Fit coupling over cable end with rounded side inboard, the ramp connector button outboard.
   b. With retaining ring side of ramp assembly facing inward, place hook of ramp around coupling button.
   c. Rotate assembly counterclockwise until tang on inner ramp fits in slot of primary cover.
   a. Thread nut on adjusting screw until slot of screw is accessible with a screwdriver.
   b. Turn adjusting screw counterclockwise until resistance is felt.
   c. Adjust clutch release mechanism. See 6.3 CLUTCH RELEASE MECHANISM.
   d. Fit nut hex into recess of outer ramp.
   e. Install clutch adjusting lockplate and spring.
4. Install clutch inspection cover and new gasket with three TORX screws with washers. Tighten in a crosswise pattern to 84-108 in-lbs (9.5-12.2 Nm).
5. Adjust clutch cable. See 1.9 CLUTCH.

WARNING

Always connect positive battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

6. Connect negative battery cable to battery terminal. Tighten fastener to 60-96 in-lbs (6.8-10.9 Nm).
7. Install seat. See 2.41 SEAT.
The purpose of the clutch is to smoothly disengage and engage the engine from the rear wheel for starting, stopping and shifting gears.

See Figure 6-12. The clutch is a wet, multiple-disc clutch with steel plates and fiber (friction) plates stacked alternately in the clutch shell. The pack consists of seven fiber plates, seven steel plates, one narrow fiber plate, one damper spring and one damper spring seat. The fiber plates (clutch driving plates) are keyed to the clutch shell, which is driven by the engine through the primary chain. The steel plates (clutch driven plates) are keyed to the clutch hub, which drives the rear wheel through the transmission and secondary drive belt.

When the clutch is engaged (clutch lever released), the diaphragm spring applies strong inward force against the pressure plate. The pressure plate then presses the clutch plates together, allowing no slippage between the plates and causing the plates to turn as a single unit. The result is that the rotational force of the clutch shell is fully transmitted through the “locked” clutch plates to the clutch hub. As long as the transmission is set in a forward gear, power from the engine will be transmitted to the rear wheel.

When the clutch is disengaged (clutch lever pulled to left handlebar grip), the pressure plate is pulled outward (by clutch cable action) against the diaphragm spring, thereby compressing the diaphragm spring. With the pressure plate retracted, strong inward force no longer squeezes the clutch plates together. The fiber plates are free to rotate at a different relative speed than that of the steel plates (i.e. – Slippage between the clutch plates occurs). The result is that the rotational force of the clutch shell is no longer fully transmitted through the “unlocked” clutch plates to the clutch hub. The engine is free to rotate at a different speed than the rear wheel.

Figure 6-12. Clutch Assembly
To protect against shock and accidental start-up of vehicle, disconnect the negative battery cable before proceeding. Inadequate safety precautions could result in death or serious injury.

1. Remove primary cover. See 6.2 PRIMARY CHAIN.

Do not attempt to disassemble the clutch without SPRING COMPRESSING TOOL (Part No. HD-38515-A), CLUTCH SPRING FORCING SCREW (Part No. HD-38515-91) and proper eye protection. Otherwise, the highly compressed diaphragm spring could fly out with great force which could result in death or serious injury.

2. See Figure 6-13. Attach tools to compress clutch diagram spring.
   a. Thread the CLUTCH SPRING FORCING SCREW (Part No. HD-38515-91) onto the clutch adjusting screw.
   b. Place the bridge of SPRING COMPRESSING TOOL (Part No. HD-38515-A) against diaphragm spring.
   c. Install bearing and washer.
   d. Thread the tool handle onto end of forcing screw.

3. See Figure 6-14. Remove pressure plate assembly.
   a. Place a wrench on the clutch spring forcing screw flats to prevent the forcing screw from turning.
   b. Turn compressing tool handle clockwise until tool relieves pressure on retaining ring and spring seat. Remove and discard retaining ring.
   c. Unseat spring seat from the groove in clutch hub prongs.
   d. Remove pressure plate assembly.

4. See Figure 6-12. Remove the clutch pack from the hub/shell assembly. The pack consists of seven fiber plates, seven steel plates, one narrow fiber plate, one damper spring and one damper spring seat.
Primary Chain/Drive

**WARNING**

To protect against shock and accidental start-up of vehicle, disconnect the negative battery cable before proceeding. Inadequate safety precautions could result in death or serious injury.

1. Remove negative battery cable from battery.
2. Remove primary cover. See 6.2 PRIMARY CHAIN.

3. Loosen engine sprocket.
   a. See Figure 6-15. Install SPROCKET LOCKING LINK (Part No. HD-38362).
   b. Remove the engine sprocket nut.
   c. Loosen but do not remove engine sprocket. If necessary, use the slotted portion of TWO CLAW PULLER (Part No. HD-97292-61) and two bolts to loosen the engine sprocket.

4. See Figure 6-16. Remove adjusting screw assembly.
   a. Remove large retaining ring.
   b. Remove adjusting screw assembly from pressure plate.

5. See Figure 6-17. Remove mainshaft nut and washer.
6. Remove the clutch assembly, primary chain and engine sprocket as a unit.
7. Inspect primary chain and sprockets for damage or excessive wear.
8. Inspect stator and rotor. See 7.7 ALTERNATOR.
9. Replace damaged parts as necessary.

---

**CAUTION**

See Figure 6-12. Mainshaft nut has left-hand threads. To prevent damage, turn nut clockwise to loosen and remove from mainshaft.
5. Install adjusting screw assembly into pressure plate.
   a. See Figure 6-18. Align two tabs on perimeter of release plate with corresponding recesses in pressure plate.
   b. See Figure 6-16. Secure the adjusting screw assembly with large retaining ring.
6. Attach tools to compress clutch diaphragm spring. See Step 2 of CLUTCH PACK under 6.4 PRIMARY DRIVE/CLUTCH.
7. Remove pressure plate assembly.

   **CAUTION**

The clutch hub and clutch shell are no longer pressed together. There are no retaining rings securing the clutch hub to the clutch shell. Once the pressure plate assembly has been removed the clutch hub will slide out of the clutch shell.

8. Remove clutch pack components. See Steps 3-4 of CLUTCH PACK under 6.4 PRIMARY DRIVE/CLUTCH.

9. See Figure 6-19. Disassemble pressure plate.
   a. Place a wrench on the clutch spring forcing screw flats to prevent the forcing screw from turning.
   b. Turn the compressing tool handle counterclockwise until the handle spins off.
   c. Remove washer, bearing and bridge.
   d. Remove clutch spring forcing screw from clutch adjusting screw.
   e. Remove spring seat and diaphragm spring from pressure plate.
10. See Figure 6-20. Remove and disassemble adjusting screw assembly.
   a. Remove large retaining ring.
   b. Remove adjusting screw assembly from pressure plate.
   c. If necessary, disassemble adjusting screw assembly. Remove and discard small retaining ring (6) and then separate the adjusting screw (8) from the bearing (7) and release plate (5). Remove bearing (7) from release plate (5).

11. Remove clutch hub from clutch shell for inspection.

   NOTE

   See Figure 6-21. The clutch shell incorporates a compensating spring set and new style needle bearing.
CLEANING AND INSPECTION

**WARNING**

Low pressure compressed air can blow debris into your face and eyes. Always wear eye protection or a face shield when using pressurized air. Failure to take adequate safety precautions could result in death or serious injury.

1. Wash all parts, except fiber (friction) plates and bearing, in cleaning solvent. Blow dry with compressed air. Examine the clutch components as follows:
   a. Check all clutch plates for wear and discoloration.
   b. Inspect each steel (drive) plate for grooves.
   c. Place each steel plate on a flat surface. Using a feeler gauge, check for flatness in several places. Replace any plates that are damaged or are warped more than 0.006 in. (0.152 mm).

2. Inspect the damper spring for cracks or distortion. Install a new spring if either condition exists.

3. See Figure 6-22. Check fiber plates for thickness.
   a. Wipe the lubricant from the eight fiber plates (7 regular and 1 narrow) and stack them on top of each other.
   b. Measure the thickness of the eight stacked fiber plates with a dial caliper or micrometer. The minimum thickness must be 0.661 in. (16.789 mm).
   c. If the thickness is less than specified, discard the fiber plates and steel plates. Install a new set of both friction and steel plates.

4. See Figure 6-23. Inspect primary chain sprocket and the starter ring gear on the clutch shell. If either sprocket or ring gear are badly worn or damaged, replace the clutch shell.

5. Inspect slots that mate with the clutch plates on both clutch shell and hub. If slots are worn or damaged, replace shell and/or hub.
6. See Figure 6-24. Inspect clutch shell needle bearing for smoothness. Rotate the clutch shell while holding the clutch hub. If bearing is rough or binds, it must be replaced. See Replacing Clutch Shell Bearing.

7. See Figure 6-25. Inspect clutch shell bearing inner race on the back side of the clutch hub for pitting and wear. If the inner race shows any of these signs the complete hub assembly must be replaced.
Replacing Clutch Shell Bearing

Removal
The XB9S clutch shell uses a caged needle bearing that corresponds to an inner race installed on the clutch hub.

1. See Figure 6-27. Place clutch shell on support blocks with sprocket side facing up.

NOTE
The CLUTCH SHELL BEARING REMOVER/INSTALLER (Part No. B-45926) is clearly marked for removal and installation purposes.

2. See Figure 6-27. Insert removal end of tool into bearing assembly and remove bearing from clutch shell.

3. Continue with CLEANING AND INSPECTION.

Installation
1. See Figure 6-28. Remove bearing guide from end of CLUTCH SHELL BEARING REMOVER/INSTALLER (Part No. B-45926).

2. Place new needle bearing onto installer end of tool and insert the bearing guide to prevent the bearing from falling off during installation and to align bearing with clutch shell.

3. See Figure 6-29. Place clutch shell on support blocks with sprocket side facing up.

4. Press bearing into clutch shell until tool bottoms on the shell. This will be the correct installed height.
Clutch Pack

1. Submerge and soak all friction and steel plates in SPORT-TRANS FLUID for at least five minutes.

2. See Figure 6-30. Assemble clutch hub and shell by sliding inboard end of clutch hub into shell bearing by hand. No tools are required for this operation.

3. See Figure 6-31. Install the narrow friction plate on the clutch hub engaging tabs on plate with slots in clutch shell.

4. See Figure 6-32. Install damper spring seat (5) on clutch hub so that it seats inboard of narrow friction plate (4).

5. Install damper spring (1) on clutch hub with the concave side up (facing opposite damper spring seat).

6. Install a steel plate and then a friction plate on the clutch hub. Install six remaining sets in the same manner, alternating between steel plates and friction plates.

---

Figure 6-30. Clutch Hub and Shell Assembly

1. Clutch hub
2. Needle bearing
3. Clutch shell
4. Thrust washer, outer

Figure 6-31. Friction Plates

1. Narrow Plate
2. Regular Plate

Figure 6-32. Clutch Pack Stack-Up (Cut-Away View)

1. Damper spring
2. Clutch hub
3. Steel plate
4. Narrow friction plate
5. Damper spring seat
6. Clutch shell

---

3. See Figure 6-32. Install damper spring seat (5) on clutch hub so that it seats inboard of narrow friction plate (4).

4. Install damper spring (1) on clutch hub with the concave side up (facing opposite damper spring seat).

5. Install a steel plate and then a friction plate on the clutch hub. Install six remaining sets in the same manner, alternating between steel plates and friction plates.
6. Place pressure plate, diaphragm spring, adjusting screw assembly with new retaining ring and spring seat onto clutch pack.
   a. See Figure 6-33. Align square openings of pressure plate and diaphragm spring so that the assembly can be installed over prongs on clutch hub.
   b. Position spring seat with its larger outer diameter side toward diaphragm spring.

CAUTION

See Figure 6-14. Turn compressing tool handle only the amount required to install spring seat and snap ring. Excessive compression of diaphragm spring could damage clutch pressure plate.

c. See Figure 6-34. Install compressing tool onto clutch hub against diaphragm spring.

d. Place a wrench on the clutch spring forcing screw flats to prevent the forcing screw from turning.

e. Turn compressing tool handle clockwise until diaphragm spring compresses just enough to install new retaining ring into the groove in clutch hub prongs.

f. With retaining ring fully seated in groove of clutch hub, carefully loosen and remove compression tool.

NOTE

When the compressing tool is removed, the diaphragm spring will move outward forcing the spring seat up into the inside of the retaining ring. The spring seat provides an operating surface for the diaphragm spring at the same time preventing the retaining ring from coming out during operation.
NOTE
If clutch pack replacement was the only service work performed, start with Step 5.

1. See Figure 6-35. Remove adjusting screw assembly in order to install mainshaft nut and washer.
2. Install the engine sprocket, clutch assembly and primary chain as a unit into primary chaincase.

NOTE
Prior to installing engine sprocket nut and the clutch hub nut, the threads on the sprocket shaft, sprocket nut, mainshaft and clutch hub nut must be thoroughly cleaned to remove any oil that might contaminate and interfere with the locking agent.

3. See Figure 6-36. Install the engine sprocket nut.
   a. Install SPROCKET LOCKING LINK (Part No. HD-38362).
   b. Apply two or three drops of LOCTITE 262 (red) onto threads of sprocket shaft.
   c. Install engine sprocket nut. Tighten to 190-210 ft-lbs (257.6-284.7 Nm).
CAUTION

See Figure 6-37. Washer must be installed with the word “out” facing the mainshaft nut or transmission may be damaged.

4. See Figure 6-37. Install mainshaft nut and washer.
   a. Apply two or three drops of LOCTITE 262 (red) onto threads on end of mainshaft.
   b. Place washer on mainshaft with the word “out” facing away from clutch hub.
   c. Install nut (left-hand threads). Tighten to 70-80 ft-lbs (94.9-108.5 Nm).
5. Remove SPROCKET LOCKING LINK.

Figure 6-37. Mainshaft Nut and Washer

1. Mainshaft nut
2. Washer
3. Clutch hub

6. Install adjusting screw assembly into pressure plate.
   a. See Figure 6-38. Align two tabs on perimeter of release plate with corresponding recesses (3) in pressure plate.
   b. Secure the adjusting screw assembly with new retaining ring.
7. Install primary cover. See 6.2 PRIMARY CHAIN.
8. Add SPORT-TRANS FLUID. See 1.9 CLUTCH.

WARNING

Always connect positive battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

9. Connect negative battery cable to battery terminal. Tighten fastener to 60-96 in-lbs (6.8-10.9 Nm).

WARNING

Pull up on seat to verify that it is properly secured, front and rear. A loose seat may shift during vehicle operation and startle the rider, possibly causing loss of vehicle control resulting in death or serious injury.

10. Install seat. See 2.41 SEAT.
GENERAL

There is no drive belt adjustment required for the Buell XB. The system utilizes a fixed idler pulley that maintains the desired tension throughout suspension travel and life of the belt.

INSPECTION & CLEANING

See 1.10 DRIVE BELT.

CAUTION

Mishandling drive belt will result in premature failure. For maximum strength, integrity and longevity, avoid over bending (A and B), twisting (C), crimping, pinching or kinking (D), and prying (E).

Figure 6-39. Proper Drive Belt Handling
DRIVE BELT REMOVAL

1. Place a scissor jack under jacking point and raise rear wheel off ground. For location of jacking point see Figure 2-99.
2. Remove right side rider footpeg support bracket. See 2.30 FOOTPEG, HEEL GUARD AND MOUNT.
3. Remove right passenger footpeg support bracket.
4. Remove chin fairing fasteners. See 2.34 CHIN FAIRING.
5. See Figure 1-40. Remove front sprocket cover (5) by removing fasteners. See 2.31 SPROCKET COVER.

NOTE
Front belt guard (4) will dangle but can not be removed at this time.
6. See Figure 1-41. Loosen rear axle pinch fastener (2).
7. Loosen rear axle (1) approximately 15 rotations to allow partial tension to be removed from rear drive system.
8. Remove idler pulley assembly by removing nuts and washers. See IDLER PULLEY REMOVAL in 6.5 DRIVE BELT SYSTEM.
9. See Figure 1-40. Remove lower belt guard (3) by removing fasteners (6).
10. Remove upper belt guard (10) by removing fasteners (7).
   
   **NOTE**
   
The upper belt guard is attached to the swingarm brace and can not be removed from vehicle at this time.
11. Remove swingarm brace. See 2.19 SWINGARM AND BRACE.
   a. Remove fastener (8) and spacer collar (2) between upper belt guard (10), inner belt guard (1) and swingarm brace.
   b. Allow inner belt guard (1) to drape.
   
   **NOTE**
   
   Inner belt guard does not have to be removed to remove belt or rear wheel.
12. Remove upper belt guard (10) by removing fasteners (9) from swingarm brace.

**CAUTION**

When removing or installing belt, do not bend or twist belt, partially slide belt onto sprocket and "roll" wheel or belt damage will occur.

13. Slide belt from sprocket and remove.

### DRIVE BELT INSTALLATION

**CAUTION**

When removing or installing belt, do not bend or twist belt, partially slide belt onto sprocket and "roll" wheel or belt damage will occur.

1. Slide belt onto sprocket.
2. See Figure 1-40. Install upper belt guard (10) to swingarm brace tightening fasteners (9) to 12-36 in-lbs (1-4 Nm).
3. Loosely install swingarm brace. See 2.19 SWINGARM AND BRACE.
   a. Position the inner belt guard (1) and upper belt guard (10) onto swingarm.
   b. Install fastener (8) and spacer collar (2) between upper belt guard (10), inner belt guard (1) and swingarm brace.
4. Install upper belt guard (10) and tighten fasteners (7) to 12-36 in-lbs (1-4 Nm).
5. Tighten swingarm brace fasteners to 25-27 ft-lbs (34-37 Nm).
6. Install lower belt guard (3) and tighten fasteners (6) to 12-36 in-lbs (1-4 Nm).
7. Install idler pulley assembly tightening washers and nuts to 33-35 ft-lbs (45-47 Nm). See IDLER PULLEY INSTALLATION in 6.5 DRIVE BELT SYSTEM.
8. See Figure 1-41. Tighten rear axle (1) to 48-52 ft-lbs (65-70 Nm).
9. Tighten rear axle pinch fastener (2) to 40-45 ft-lbs (54-61 Nm).
10. Rotate rear wheel to ensure the belt does not make visible or audible contact. It may be necessary to loosen belt guard(s) to adjust for proper clearance.
11. See Figure 1-40. Install front sprocket cover (5) by tightening fasteners to 12-36 in-lbs (1-4 Nm). See 2.31 SPROCKET COVER.
12. Install chin fairing fasteners and tighten to 36-48 in-lbs (4-5 Nm). See 2.34 CHIN FAIRING.
13. Install right side rider footpeg mount and tighten fasteners to 108-132 in-lbs (12-15 Nm). See 2.30 FOOTPEG, HEEL GUARD AND MOUNT.
15. Remove scissor jack from motorcycle.

### IDLER PULLEY REMOVAL

1. See Figure 1-42. Loosen rear axle pinch fastener (2).
2. Unthread axle approximately 15 rotations to release tension from drive belt.
3. Remove chin fairing fasteners. See 2.34 CHIN FAIRING.
4. Remove front sprocket cover. See 2.31 SPROCKET COVER.
5. See Figure 1-43. Remove idler pulley bracket nuts and washers (5) from studs (3).
6. Slide idler pulley bracket (4) off studs (3).
7. Inspect pulley by spinning wheel (1) and checking for wheel bearing wear.
8. If pulley wheel needs replacement, remove fastener (6), washer and nut (2) from idler pulley bracket (4) and discard wheel. Replace with new pulley wheel (1).

NOTE
The pulley wheel bearings can not be replaced separately.

IDLER PULLEY INSTALLATION

1. See Figure 1-43. Install new or existing pulley wheel (1), if removed, and tighten washer and nut (2) wheel fastener (6) to 20-23 ft-lbs (27.1-31.2 Nm).
2. Slide idler pulley bracket (4), washer and nuts (5) on to studs (3) and tighten to 33-35 ft-lbs (45-47 Nm).
3. Install front sprocket cover. See 2.31 SPROCKET COVER.
4. Install chin fairing fasteners and tighten to 36-48 in-lbs (4-5 Nm). See 2.34 CHIN FAIRING.

**CAUTION**
Never tighten rear axle with swingarm brace removed.

5. See Figure 1-42. Tighten rear axle to 48-52 ft-lbs (65-70 Nm).
6. Tighten rear axle pinch fastener (2) to 40-45 ft-lbs (54-61 Nm).

---

Figure 1-42. Rear Wheel Mounting, Right Side

Figure 1-43. Idler Pulley Assembly
GENERAL

See Figure 6-44. The XB9S transmission is a five-speed constant-mesh type housed in an extension of the crankcase.

Figure 6-44. Transmission Power Flow
GENERAL

The rear compartment of the left and right crankcase halves form the transmission case. Servicing of transmission components requires removing the engine and disassembling (splitting) the crankcase.

RIGHT CRANKCASE REMOVAL

1. Remove transmission sprocket. See 6.15 TRANSMISSION SPROCKET.
2. Remove engine from chassis. See 3.4 STRIPPING MOTORCYCLE FOR ENGINE SERVICE.
4. Disassemble top end. See 3.6 CYLINDER HEAD.
5. Disassemble gearcase. See 3.16 GEARCASE COVER AND CAM GEARS.
6. Remove primary cover. See 6.2 PRIMARY CHAIN.
7. Remove clutch assembly, primary chain and engine sprocket. See 6.4 PRIMARY DRIVE/CLUTCH.
8. See Figure 6-45. Place transmission in 1st gear. Remove countershaft TORX screw (1) and retention collar (2).
9. See Figure 6-46. Place transmission in neutral. Remove neutral switch to ensure shifter drum detent is visible indicating transmission is in correct location.
10. See Figure 6-48. Remove shifter shaft assembly.

11. See Figure 6-47. Depress ratchet arms in order to clear the shifter drum and remove shifter shaft assembly from left crankcase half.

12. Remove starter. See 5.7 STARTER.

13. See Figure 6-49. Remove rear isolator assembly by removing the forward two fasteners first and then the two rear fasteners (re-install with new fasteners).

14. See Figure 6-50. Scribe a line on the end of the shifter drum at the 12 o’clock position for later reference.

15. See Figure 6-51. Place transmission in 4th gear. The scribed line should now be at the 6 o’clock position.

**NOTE**
Transmission can be easily shifted by rotating the mainshaft and shifter drum at the same time by hand.
16. See Figure 6-52. Remove crankcase bolt set (14 fasteners).

NOTE
Flywheel assembly slides out of the left main bearing by hand. No tools are required for this operation.

17. See Figure 6-53. Separate crankcase halves.

18. See Figure 6-54. Remove the flywheel assembly from left crankcase half.
NOTE
See Figure 6-57. Shifter design allows for one common part number for all three shifter forks. As the transmission runs, each shifter fork develops a certain wear pattern with its mating parts. For this reason, it is important that each shifter fork be reinstalled in its original location.

Figure 6-55. Removing Shifter Fork Shafts

1. Slots for removing the shifter fork shafts

Figure 6-56. Transmission Assembly

2. See Figure 6-56. Remove shifter drum and shifter forks.

3. Remove mainshaft 2nd gear from mainshaft.
Always wear proper eye protection when installing retaining rings. Use the correct retaining ring pliers. Verify that the tips of the pliers are not damaged or excessively worn. Slippage may propel the ring with enough force to cause eye injury.

4. See Figure 6-59. Remove left crankcase half and transmission assembly (4) from engine stand.
   a. Place crankcase half (3) and transmission assembly (4) on arbor press (1) and support transmission assembly on parallel supports (5).
   b. Press transmission assembly using TRANSMISSION REMOVER (2) (Part No. B-43895-1) to remove transmission assembly from crankcase half.
   c. Remove crankcase from press.
NOTE

- As the transmission runs, each part develops a certain wear pattern and a kind of “set” with its mating parts. For this reason, it is important that each component be reinstalled in its original location and facing its original direction.

- See Figure 6-60. As each component is removed, place it on a clean surface in the exact order of removal.

21. Retaining ring
22. Countershaft retainer
23. Screw

Figure 6-62. Transmission Assembly-Left Crankcase Half
NOTE

- Once the transmission assembly has been pressed out of the left crankcase half, the mainshaft and countershaft assemblies can be serviced separately.
- All thrust washers are one common part number. There is no shimming required with this transmission.

WARNING

Always wear proper eye protection when removing retaining rings. Use the correct retaining ring pliers. Verify that the tips of the pliers are not damaged or excessively worn. Slippage could propel the ring with enough force to cause death or serious injury.

1. See Figure 6-63. Remove spacer (1), mainshaft 4th gear (3), split bearing (2) and thrust washer (4) from the threaded end of the mainshaft.

2. On the mainshaft, between mainshaft 1st gear (6) and mainshaft 3rd gear (10), use RETAINING RING PLIERS (Part No. J-5586) to expand retaining ring (7) and move next to mainshaft 1st gear along with thrust washer (8).
   a. Move mainshaft 3rd gear (10) as far as possible toward mainshaft 1st gear (6).
   b. Expand retaining ring (12) at opposite side of main shaft 3rd gear (10) and slide off end of mainshaft with thrust washer (11).
   c. Remove mainshaft 3rd gear (10) and its split bearing (9).

3. Slide thrust washer (8) off end of mainshaft.

4. Expand retaining ring (7), which is next to mainshaft 1st gear (6), and slide off end of shaft.

5. Remove mainshaft 1st gear (6).

6. Expand retaining ring (5) and remove.

Cleaning And Inspection

WARNING

Never use compressed air to “spin-dry” bearings. Spinning bearings with compressed air can also cause a bearing to fly apart, which could result in death or serious injury.

Low pressure compressed air can blow debris into your face and eyes. Always wear eye protection or a face shield when using pressurized air. Failure to take adequate safety precautions could result in death or serious injury.

1. Clean all parts (except bearings) in cleaning solvent and blow dry with compressed air.

2. Check gear teeth for damage. If gears are pitted, scored, rounded, cracked or chipped, they should be replaced.

3. Inspect the engaging dogs on the gears. Replace the gears if dogs are rounded, cracked, battered, chipped or dimpled.

4. Discard all retaining rings that were removed.

---

![Figure 6-63. Transmission Mainshaft Assembly Once Removed from Left Crankcase/Disassembly](image-url)
COUNTERSHAFT DISASSEMBLY

NOTE

- Once the transmission assembly has been pressed out of the left crankcase half, the mainshaft and countershaft assemblies can be serviced separately.
- All thrust washers are one common part number. There is no shimming required with this transmission.

WARNING

Always wear proper eye protection when removing retaining rings. Use the correct retaining ring pliers. Verify that the tips of the pliers are not damaged or excessively worn. Slippage could propel the ring with enough force to cause death or serious injury.

1. See Figure 6-64. Remove spacer (1) and countershaft 4th gear (2) from the end of the countershaft with internal threads.

2. Using RETAINING RING PLIERS (Part No. J-5586), remove and discard retaining ring (3) next to countershaft 5th gear (4).
   a. Slide countershaft 5th (4), and countershaft 2nd (5) off end of countershaft.
   b. Remove split bearing (6) that was under countershaft 2nd gear (5) and thrust washer (7).
   c. Remove retaining ring (8) on the countershaft and slide countershaft 3rd gear (9) off free end of countershaft.

3. Expand retaining ring (10) located next to countershaft 1st gear (11). Remove retaining ring (10) and thrust washer (11).
   a. Slide countershaft 1st gear (13) off end of shaft.
   b. Remove split bearing (12).

4. Remove thrust washer (14). Expand remaining retaining ring (15) and slide off countershaft.

Cleaning And Inspection

WARNING

Never use compressed air to “spin-dry” bearings. Spinning bearings with compressed air can also cause a bearing to fly apart, which could result in death or serious injury.

1. Clean all parts (except bearings) in cleaning solvent and blow dry with compressed air.
2. Check gear teeth for damage. If gears are pitted, scored, rounded, cracked or chipped, they should be replaced.
3. Inspect the engaging dogs on the gears. Replace the gears if dogs are rounded, cracked, battered, chipped or dimpled.
4. Discard all retaining rings that were removed.
WARNING
Always wear proper eye protection when removing retaining rings. Use the correct retaining ring pliers. Verify that the tips of the pliers are not damaged or excessively worn. Slippage could propel the ring with enough force to cause death or serious injury.

CAUTION
During assembly, the split bearings and the internal bores of the gears must be lubricated with SPORT-TRANS FLUID prior to assembly. Leaving these parts dry could accelerate wear at start-up.

1. See Figure 6-66. Install new retaining ring (1) onto mainshaft in the first ring groove from the threaded end of the mainshaft.

2. Slide mainshaft 1st gear (2), identified by two grooves in gear teeth, onto mainshaft with the fork groove facing mainshaft 4th gear (10).

   NOTE
   See Figure 6-65. The shifting fork groove on mainshaft 1st gear has been made 0.020 in. (0.5 mm) wider than existing mainshaft first gear (Part No. 35762-89A) to accommodate the new style shifting fork and has a new part number.

3. See Figure 6-66. Install new retaining ring (3).
   a. Install thrust washer (4) onto mainshaft.
   b. Install split bearing (5) onto mainshaft.
   c. Install mainshaft 3rd gear (6) onto shaft over bearing (5). 3rd gear is installed with shifting lugs away from 1st gear mainshaft.

4. Install thrust washer (7) and new retaining ring (8) next to mainshaft 3rd gear (6).

5. Install thrust washer (9) on threaded end of mainshaft next to retaining ring (1).

6. Install split bearing (10) onto mainshaft next to thrust washer (9).

7. Install mainshaft 4th gear (11), which can be identified by the two radial grooves on one side, onto mainshaft over split bearing (10) and against thrust washer (9).

8. Install spacer (12) onto end of mainshaft.

Figure 6-65. New Mainshaft 1st Gear with Identification Grooves

Figure 6-66. Transmission Mainshaft Assembly/Reassembly
COUNTERSHAFT ASSEMBLY

**WARNING**

Always wear proper eye protection when removing retaining rings. Use the correct retaining ring pliers. Verify that the tips of the pliers are not damaged or excessively worn. Slippage could propel the ring with enough force to cause death or serious injury.

**CAUTION**

During assembly, the split bearings and the internal bores of the gears must be lubricated with SPORT-TRANS FLUID prior to assembly. Leaving these parts dry could accelerate wear at start-up.

1. See Figure 6-67. Install new retaining ring (1) and thrust washer (2) onto countershaft in the second ring groove from the end with internal threads.
2. Install split bearing (4) onto countershaft.
3. Locate countershaft 1st gear (3), identified by one radial groove at one side, and slide gear onto shaft. Position gear over bearing (4).
4. Install thrust washer (5) and new retaining ring (6) next to countershaft 1st gear (3).
5. Install countershaft 3rd gear (7) on countershaft with fork groove facing away from countershaft 1st gear (3).
6. Install new retaining ring (8) on countershaft. Position new retaining ring in the second ring groove from the end. Install thrust washer (9) next to retaining ring (8). Install split bearing (10) in seat next to washer (9).
7. Install countershaft 2nd gear (11) with the locking dogs facing countershaft 3rd gear (7).
8. Install new retaining ring (13) on countershaft.

At this point both mainshaft and countershaft sub-assemblies are ready to be pressed into the left crankcase half.

---

REMOVAL

1. Split crankcases in half. See 6.7 CASE DISASSEMBLY FOR TRANSMISSION REMOVAL.

2. Remove transmission as an assembly. See 6.8 TRANSMISSION DISASSEMBLY.

3. See Figure 6-68. From inside case tap out seal at end of mainshaft 5th gear. Discard seal.

4. See Figure 6-69. Place cross plate on crankcase as shown.

5. See Figure 6-70. Assemble MAIN DRIVE GEAR REMOVER AND INSTALLER (Part No. HD-35316-A) with CROSS PLATE (Part No. B-45847).

6. Insert bolt (2) through cross plate (1) and 5th gear (3).

CAUTION

When removing the main drive gear, the gear is pressed out against the resistance of the bearing inner race. Without any support at the inner race, the bearing is destroyed. Whenever the main drive gear is removed the main drive gear bearing will also have to be replaced.

7. At outside of case, place driver (4) and thrust washer (5) over end of bolt (2). Install and tighten nut (6) until 5th gear (3) is free.
DISASSEMBLY

Drive out needle bearings from inside bore of main drive gear. Do not reuse bearings after removal.

ASSEMBLY

1. See Figure 6-71. Use INNER/OUTER MAIN DRIVE GEAR NEEDLE BEARING INSTALLATION TOOL (Part No. HD-37842-A) for assembly. Select which end of tool to use.
   a. The end stamped 0.080 in. (2.032 mm) is for driving the bearing into the inner end.
   b. The end stamped 0.315 in. (8.001 mm) is for the outer end bearing.

2. Assemble parts. The installation tool will automatically bottom on the gear when the correct depth is reached.
   a. Place main drive gear on a press.
   b. Press in the outer bearing to a depth of 0.315-0.285 in. (8.001-7.239 mm).
   c. Press in the inner bearing to a depth of 0.080 in. (2.032 mm).

INSTALLATION

1. Replace main drive gear bearing.

2. See Figure 6-72. Use MAIN DRIVE GEAR REMOVER AND INSTALLER (Part No. HD-35316-A) for assembly.
   a. Take bolt (2) and place washer (5) followed by main drive gear (4) over end of bolt.
   b. From inside of case insert bolt and main drive gear through inner race of ball bearing.
   c. Insert threaded end of bolt (2) through installer cup (3) and thrust washer (1).
   d. Thread nut (6) onto end of bolt (2). Tighten nut (6) until shoulder on gear (4) bottoms against inner race of bearing.

Figure 6-71. Needle Bearing Installation Tool

1. Ram on end of press
2. Needle bearing installation tool
3. Main drive gear

Figure 6-72. Main Drive Gear Installation

1. Thrust washer
2. Bolt
3. Installer cup
4. Main drive gear
5. Washer
6. Nut
3. See Figure 6-73. Tap in new seal (3) at threaded end of 5th gear to a depth of 0.060-0.030 in. (1.524-0.762 mm).

4. See Figure 6-74. Place new quad ring over threaded end of fifth gear, and position next to the gear taper. Install spacer over threaded end of fifth gear with chamfered end toward quad ring. Slide spacer up against bearing.

5. Install large seal.
   a. Coat lips of seal with SPORT-TRANS FLUID.
   b. Position seal over spacer with lips of seal toward case.
   c. Use MAIN DRIVE GEAR SEAL INSTALLER (Part No. HD-41496) to gently tap seal into bore of case until the outside of seal is flush with outer edge of bore.

   **NOTE**
   It is acceptable to recess seal to about 0.030 in. (0.762 mm) below outer edge of bore. Seal will be controlled by tool.

Figure 6-73. Main Drive Gear Assembly

Figure 6-74. Transmission Assembly Right Crankcase Half
REMOVAL

NOTE
See Figure 6-74. Refer to Transmission assembly right crank-case half, for location of items discussed on this page.

1. Remove transmission assembly. See 6.8 TRANSMISSION DISASSEMBLY.

2. See Figure 6-74. Remove main drive 5th gear. Use MAIN DRIVE GEAR REMOVER AND INSTALLER (Part No. HD-35316A). See 6.10 MAIN DRIVE GEAR.

3. At outside of case remove seal next to 5th gear bearing retainer. Remove retaining ring.

4. From inside transmission case drive bearings (5th gear, countershaft or shifter shaft) out of bores. Carefully tap bearings free by working around bearing diameter to keep bearing from skewing.

INSTALLATION

Mainshaft 5th Gear Ball Bearing

1. See Figure 6-75. Locate MAIN DRIVE GEAR REMOVER AND INSTALLER (Part No. HD-35316-A). Place cross-plate pins in appropriate holes in transmission case.

2. See Figure 6-76. Insert bolt (2) through cross plate (1), new bearing (3), driver (4) and thrust bearing (5). Thread nut (6) on end of bolt. Tighten nut carefully until bearing is started in bore squarely. Tighten nut (6) until bearing is seated against shoulder in bore.

3. At outside of case install beveled retaining ring in groove inside bearing bore with beveled side facing outside of case.

4. Lubricate bearing with SPORT-TRANS FLUID.

Countershaft Needle Bearing

1. Find a suitable bearing driver 1-1/4 in. (31.75 mm) in diameter.

2. See Figure 6-74. From the outside of the case place the needle bearing open end first next to the bearing bore. Hold the driver squarely against the closed end of the bearing and tap the bearing into place. The bearing is properly positioned when it is driven inward flush or 0.030 in. (0.762 mm) below the outside surface of the case.

3. Lubricate bearing with SPORT-TRANS FLUID.

Shifter Drum Bushing

4. See Figure 6-74. The shifter drum bushing (11) is a press fit in the right crankcase half. Inspect the bushing against the corresponding end of the shifter drum for proper fit and wear.

5. If bushing is to be replaced, use a BUSHING AND BEARING PULLER (Part No. HD-95760-69A) with a 1/2 in. collet (Part No. HD-95765-69A) to remove bushing from right crankcase half.

6. To install new bushing, use SNAP-ON BUSHING DRIVER SET (Part No. A-157C) with a 1/2 inch adapter (Part No. A157-8).

7. Lubricate bushing with SPORT-TRANS FLUID.

22. Countershaft retainer
23. Screw
REMOVAL

NOTE

See Figure 6-77. Refer to Transmission assembly left crankcase half, for location of items discussed on this page.

Mainshaft and Countershaft Bearings

1. Split crankcases in half. See 6.7 CASE DISASSEMBLY FOR TRANSMISSION REMOVAL.

2. Remove shifter forks and drum. See 6.9 TRANSMISSION ASSEMBLY under 6.8 TRANSMISSION DISASSEMBLY.

3. Remove countershaft and mainshaft. See 6.8 TRANSMISSION DISASSEMBLY.

4. Inspect the mainshaft and countershaft ball bearings for pitting, scoring, discoloration or other damage.

5. See Figure 6-78. If bearing replacement is required, remove retaining rings (1, 2) using snap ring pliers (Snap-On Part No. PR-36). Press out bearings (3, 4) from the inside of the crankcase.

Shift Drum Bushing

Inspect the shifter drum bushing for pitting, scoring, discoloration or excessive wear. If bushing requires replacement press bushing out of crankcase from either side.

INSTALLATION

Mainshaft and Countershaft Bearings

1. Place crankcase on press with inside surface of crankcase downward.

2. Lay bearing squarely over bore with printed side of bearing upward. Place a pressing tool (slightly smaller than outside diameter of bearing) against outer race. Press bearing into bore until bearing bottoms against shoulder.

3. Install new retaining ring with beveled side facing away from bearing.

Shift Drum Bushing

1. Place crankcase on press with outside surface of crankcase downward.

2. See Figure 6-79. Lay bushing squarely over bore. Using a pressing tool larger than diameter of bushing, press bushing into bore until bushing contacts shoulder in left crankcase half. If using a pressing tool larger than diameter of bushing, the pressing tool will bottom against crankcase when bushing is flush with top surface.
NOTE
After re-installing the transmission assembly, verify that all parts have been properly installed. See Figure 6-77.

- 6.10 MAIN DRIVE GEAR
- 6.9 TRANSMISSION ASSEMBLY
- 6.12 TRANSMISSION LEFT CASE BEARINGS
- 6.11 TRANSMISSION RIGHT CASE BEARINGS

---

1. See Figure 6-80. Place transmission assembly onto TRANSMISSION REMOVER/INSTALLER FIXTURE (Part No. B-43985-2) on arbor press.
2. Install COUNTERSHAFT GUIDE ADAPTER (Part No. B-43985-4).

---

Figure 6-80. Transmission Assembly in Fixture

1. Arbor press
2. Guide tool (Part No. B-43985-4)
3. Transmission assembly
4. Transmission Remover/Installer fixture (Part No. B-43985-2)

---

Figure 6-81. Installing Transmission in Left Case Half

1. Arbor press
2. Transmission Installer (Part No. B-43985-3)
3. Transmission assembly
4. Left case half

---

3. See Figure 6-81. Place left case half over transmission assembly and install TRANSMISSION INSTALLER (Part No. B-43985-3) into crankcase.
4. See Figure 6-81. Press crankcase onto transmission assembly into until it bottoms out.
5. Remove COUNTERSHAFT GUIDE ADAPTER (Part No. B-43985-4).
6. Remove transmission assembly and left crankcase half from fixture.
7. Re-install transmission assembly and left crankcase half in engine stand.
8. Install mainshaft 2nd gear with shifter fork groove towards mainshaft 3rd gear.
9. Install shifter forks, shafts and shifter drum. See 6.9 TRANSMISSION ASSEMBLY.
SHIFTER FORKS AND DRUM ASSEMBLY

NOTES

- **See Figure 6-82.** Shifter fork design allows for one common part number for all three shifter forks. As the transmission runs, each shifter fork develops a certain wear pattern with its mating parts. For this reason, it is important that each shifter fork be reinstalled in its original location.

- Always lubricate the shaft bore in each shifting fork with Sport Transmission Lube before assembly.

1. Place the 4th gear shifter fork on the appropriate mainshaft sliding gear.
2. Install the shifter drum into the left case half with the previously scribed line at the 6 o’clock position. This will place the shifter drum in the 4th gear position.
3. **See Figure 6-83.** Place the 3rd and 5th gear shifter fork on the appropriate mainshaft sliding gear and install the shifter fork shaft through the two installed shifter forks and into the left case half.
4. Install the 1st and 2nd gear shifter fork on the appropriate countershaft sliding gear and install the remaining shifter fork shaft through the last installed shifter fork and into the left case half.

**NOTE**

See Figure 6-83. Install shifter fork shafts in the left case half by lightly tapping on the end with a brass hammer until seated in bore.
Figure 6-84. Crankcase Fasteners

- Indicates Bolt Pattern Location

One Behind Shifter Mechanism
INSTALLING RIGHT CRANKCASE

1. See Figure 6-85. Install the flywheel assembly into the left crankcase half using CRANKSHAFT GUIDE TOOL Part No. HD-42326.

![Image 6-85. Installing Flywheel Assembly Using Crankshaft Guide Tool (Part No. HD-42326)]

NOTE
The Gear Detent Assembly Aid is used to move the gear detent lever clear of the shifter drum for assembly purposes.

2. See Figure 6-86. Retract detent assembly in right case half and install GEAR DETENT ASSEMBLY AID (Part No. B-45520) until it has bottomed in right case half.

![Image 6-86. Gear Detent Assembly Aid (Part No. B-45520)]

3. See Figure 6-87. Place Transmission in the 4th gear position. The scribed line on the shifting drum should be at 6 o’clock.

![Image 6-87. Scribed Line on Shifter Drum at 6 O’clock (Transmission in 4th Gear)]

4. See Figure 6-88. Assemble crankcase halves together.
   a. Apply a thin coat of DOW CORNING SILASTIC #732 clear sealant to crankcase joint faces.
   b. Apply several drops of LOCTITE 262 (red) to last few threads.
   c. See Figure 6-84. Tighten 5/16-in. fasteners to 15-19 ft-lbs (20.3-25 Nm).

![Image 6-88. Crankcase Halves]
INSTALLATION

1. See Figure 6-89. Correctly install shifter return spring onto the reverse side of the shifter shaft assembly before placing shaft in left crankcase half.

   ![Figure 6-89. Shifter Shaft Return Spring (Correctly Installed)](image)

   **CAUTION**

   See Figure 6-90. The shifter shaft return spring can be installed incorrectly and then assembled in the left crankcase half. Failure to install the spring properly will result in improper shifting.

   ![Figure 6-90. Shifter Shaft Return Spring (Incorrectly Installed)](image)

2. See Figure 6-91. Depress ratchet arms and insert shaft assembly into the bushing in the left case half and release. Ratchet arms should now be inside the end plate of the shifter drum contacting the shifter drum pins.

   ![Figure 6-91. Installing Shifter Shaft Assembly](image)

3. See Figure 6-92. Position retention collar (2) next to end of countershaft with beveled side facing outward.
   a. Apply several drops of LOCTITE 243 (blue) to last few threads.
   b. Insert screw (1) through retention collar (2) and thread into end of shaft.
   c. Place transmission in gear and tighten TORX screw (1) to 13-17 ft-lbs (18-23 Nm).

   ![Figure 6-92. Countershaft Retainer](image)

</tbody>
</table>

1. Loosen rear axle pinch fastener. See IDLER PULLEY REMOVAL/6.5 DRIVE BELT SYSTEM.

2. Unthread axle approximately 15 threads to release tension from drive belt.

3. Remove front sprocket cover. See 2.31 SPROCKET COVER.

4. See Figure 6-93. Remove both bracket nuts with washers (5) attaching idler pulley bracket (4) to studs (3).

5. Slide idler pulley assembly off studs.

6. Inspect pulley by spinning wheel (1) and checking for excessive wheel bearing wear.

7. If pulley wheel needs replacement, remove fastener (6) and nut (2) from idler pulley bracket (4) and discard. Replace with new pulley wheel (1).

**NOTE**

The pulley wheel bearings can not be replaced separately. A new pulley wheel must be installed.

8. See Figure 6-94. Place transmission in first gear. Remove two socket head screws (1) and lockplate (2).

**CAUTION**

Transmission sprocket nut has left-hand threads. Turn nut clockwise to loosen and remove from main drive gear shaft.

9. Remove transmission sprocket nut (3) from main drive gear (5) using MAINSHAFT LOCKNUT WRENCH (Part No. HD-94660-37B). Use an air impact wrench for best results.

10. Remove secondary drive belt from transmission sprocket. Remove transmission sprocket (4) from main drive gear (5).
1. See Figure 6-94. Install transmission sprocket (4) with secondary drive belt onto main drive gear (5).

2. Place transmission in neutral.

3. Apply a few drops of LOCTITE 262 (red) to the left-hand threads of transmission sprocket nut (3) and lightly coat the washer-faced side with clean H-D 20W50 engine oil. Wipe off any excess oil.

4. Position nut with washer-faced side facing transmission sprocket. Turn the nut counterclockwise to install it onto main drive gear.

5. See Figure 6-95. Install SPROCKET HOLDING TOOL (Part No. B-45659) as shown.

6. Using MAINSHAFT LOCKNUT WRENCH (Part No. HD-94660-37B) and a torque wrench, tighten sprocket nut to 50 ft-lbs (67.8 Nm) INITIAL TORQUE ONLY.

7. See Figure 6-96. Scribe a line on the transmission sprocket nut and continue the line on the transmission sprocket as shown.

8. Tighten the transmission sprocket nut an additional 30°-40°.

9. See Figure 6-94. Install lockplate over nut so that two of lockplate’s four drilled holes (diagonally opposite) align with sprocket’s two tapped holes.

   **NOTE**
   The lockplate has four screw holes and can be turned to either side, so you should be able to find a position without having to additionally tighten the nut. If you cannot align the screw holes properly, the nut may be additionally TIGHT-ENED until the screw holes line up, but do not exceed 45°. NEVER LOOSEN nut to align the screw holes.

   **CAUTION**
   Maximum allowable tightening of sprocket nut is 45° of counterclockwise rotation, after initially tightening to 50 ft-lbs. Do not loosen sprocket nut while attempting to align the screw holes. If you cannot align lockplate and sprocket screw holes, nut may be additionally tightened 45° as specified above. Tightening too much or too little may cause the nut to come loose during vehicle operation. If you cannot align lockplate and sprocket screw holes, nut may be additionally tightened until screw holes align.

10. See Figure 6-94. Install two socket head screws through aligned holes of lockplate and into tapped holes of sprocket. Tighten to 90-110 in-lbs (10.2-12.4 Nm).

   **NOTE**
   The original equipment socket head screws (1) have thread-locking compound applied to them. Since this compound remains effective for about three removal/installation cycles, the original screws may be reused up to three times. After the third removal/installation cycle, replace both screws with new screws identical to the original.
11. See Figure 6-93. Slide idler pulley assembly on to studs (3), install nuts and washers (5) and tighten to 33-35 ft-lbs (44.74-47.45 Nm).

12. Install front sprocket cover. See 2.31 SPROCKET COVER.

**CAUTION**

*Never remove rear axle with swingarm brace removed.*

13. See Figure 6-97. Tighten rear axle (1) to 48-52 ft-lbs (65-70 Nm).

14. Tighten rear axle pinch fastener (2) to 40-45 ft-lbs (54-61 Nm).

15. Install clutch assembly, primary chain and engine sprocket. See 6.4 PRIMARY DRIVE/CLUTCH.

16. Install primary cover. See 6.2 PRIMARY CHAIN.

17. Assemble gearcase. See 3.16 GEARCASE COVER AND CAM GEARS.

18. Assemble top end. See 3.6 CYLINDER HEAD.

19. Remove engine from ENGINE SUPPORT STAND (Part No. HD-42310/HD-43646 or HD-43682).

20. Install engine in chassis. See 3.4 STRIPPING MOTORCYCLE FOR ENGINE SERVICE.

21. Fill transmission and engine to proper level with fresh lubricant. See 1.2 FUEL AND OIL.

IGNITION SYSTEM

GENERAL

The vehicle uses a breakerless inductive-discharge ignition system. The system has both a primary and secondary circuit. The primary circuit consists of the battery, main fuse, ignition switch, primary coil windings, computerized ignition timer and associated wiring. The secondary circuit consists of the secondary coil, spark plugs and associated wiring. See Figure 7-1.

DIGITAL TECHNICIAN (Part No. HD-44750) can access the information received by and stored in the electronic control module.

The electronic control module (ECM) is located under the seat. The module has three primary functions. First, it computes the spark advance for proper ignition timing based on sensor input. Second, it controls the independent, primary windings of the spark coil and is thus able to provide sequential and independent firing of the spark plugs (non waste spark). Third, it calculates the correct air/fuel ratio based on input from the sensors.

The electronic control module contains all the solid-state components used in the ignition system. The dwell time for the ignition coil is also calculated by the ECM microprocessor and is dependent upon battery voltage. The programmed dwell is an added feature to keep battery drain to a minimum and is dependent upon battery voltage, continuous reverse voltage protection and damage due to jump starts. The ECM is fully enclosed to protect it from vibration, dust, water and oil. The module is not repairable. Replace the unit if it fails.

The ECM uses six different sensors to monitor rider demands and changing engine conditions. These sensors are:

- Throttle Position (TP) Sensor
- Cam Position (CMP) Sensor
- Intake Air Temperature (IAT) Sensor
- Engine Temperature (ET) Sensor
- Oxygen (O2) Sensor
- Bank Angle Sensor (BAS)

The ECM uses the information provided by the throttle position and cam position sensors to calculate how much air is entering the engine. The throttle position sensor monitors the amount of air entering the engine by how far the throttle is open, whether it is opening or closing and how fast it is opening or closing. The IAT sensor measures the temperature of the air entering the engine, providing the rest of the information necessary to determine the density of the air entering the engine. The ECM also monitors the cam position sensor to determine the exact position of both cylinders in the combustion cycle and the engine speed.

The ET sensor provides the ECM the current engine temperature. Proper fuel and spark delivery are dependent on the temperature of the engine. The ECM will provide a richer fuel mixture on start up and a higher degree of spark advance. As the vehicle warms up to operating temperature the fuel mixture will lean and the spark advance will decrease.

Cooling fan actuation is controlled by the ECM. With key ON, fan turns on when engine cylinder head temperature reaches 220°C (428°F) and shuts off when temperature reaches 180°C (356°F). With key OFF, fan turns on when engine temperature reaches 170°C (338°F) and shuts off when temperature reaches 150°C (302°F).

The information provided by the O2 sensor allows the ECM to ensure a proper air/fuel mixture by monitoring the final combustion efficiency in the exhaust system. This ensures optimum engine performance at any altitude or barometric pressure. The O2 sensor input to the ECM is required to ensure a stoichiometric (14.7:1) air/fuel ratio during closed loop operation.

The Bank Angle Sensor (BAS) provides input to the ECM on whether the vehicle lean is greater than predetermined bank angle limit. As long as lean angle does not exceed limit, fuel supply and ignition operation are unaffected. If the vehicle exceeds the predetermined bank angle limit, the BAS will interrupt the operation of the ignition system and fuel supply. To reset system, return vehicle to the upright position and switch key OFF.

The ECM-controlled ignition coil fires each spark plug independently on the compression stroke of each cylinder (no waste spark). The spark plug in the front cylinder fires at the end of that cylinder’s compression stroke, thereby igniting the air/fuel mixture. The same sequence occurs at the end of the rear cylinder’s compression stroke (thereby igniting the air/fuel mixture in the rear cylinder).

The rotor and cam position sensor are located in the gearcase cover on the right side of the motorcycle. The Cam position sensor consists of a Hall-effect device, magnet and plate. The plate is mounted over a rotating cup ("rotor cup"). The rotor cup is mounted on the camshaft and operates at one-half crankshaft speed. As the rotor cup turns inside the gearcase, six asymmetrical teeth on the rotor cup sequentially break the magnetic field between the magnet and the Hall-effect device. The edges of these teeth are cut to correspond to specific positions of the camshaft during the engine cycle such as TDC for the front cylinder. The output of the cam position sensor is used by the ECM to not only determine engine position, but also to calculate engine speed. This method of measuring camshaft position provides accurate information on engine position down to zero engine speed.

For more information on the sensors used in conjunction with the ECM see Section 4 Fuel System.

See the wiring diagrams in the Appendix for additional information on ignition system circuits.

Figure 7-1. Ignition System Components
GENERAL

WARNING
DO NOT modify the ignition/headlight switch wiring to circumvent the automatic-on headlight feature. Visibility is a major concern for motorcyclists. Failure to have proper headlight operation could result in death or serious injury.

Switch positions are explained in Table 7-8.

CAUTION
When turning off the ignition, verify that the key is removed in the OFF position and that the lights are not left on. If the rider stops the engine and inadvertently removes the key in the P position, the battery will be drained of its charge if the vehicle is left standing too long.

NOTE
The key locks the ignition system and is removable in both the LOCK and P positions. The P position is located counterclockwise from the LOCK position and allows the rider to remove the key while leaving the lights on. When the key is placed in the P position, several indicator markers are or can be activated. Refer to Table 7-9.

Figure 7-2. Ignition/Headlight Key Switch
1. Remove seat. See 2.41 SEAT.

**WARNING**

To protect against accidental start-up of vehicle, disconnect the negative battery cable before proceeding. Inadequate safety precautions could result in death or serious injury.

2. Disconnect negative battery cable.

3. Remove windscreen.

4. See Figure 7-3. Disconnect:
   - Turn signal flasher [30]
   - Turn signals [31]
   - Left [24] and right [22] handlebar wiring harnesses
   - Instrument cluster [39]
   - Horn [122]

5. Remove horn (12) from horn mount (10).

6. Cut cable strap (7) that loosely holds main wiring harness (8) to the ignition switch (6) and disconnect ignition switch connector [33].

---

**Figure 7-3. Electrical Connectors Behind Windscreen**

11. Horn connector [122]
12. Horn
7. See Figure 7-4. Use Snap-on Tamper-Resistant T45 Torx driver (Part No. FTXR45E) to remove the two tamper-resistant Torx fasteners (2) securing ignition switch to upper fork clamp.

8. Remove the final ignition switch fastener (1) along with spacer located behind the ignition switch.

9. While holding the throttle cables (3) to your left (the right side of the vehicle), pull the ignition switch (4) toward you and roll the assembly away from you until the fork stop pin (5) is pointing down.

10. Slide the ignition switch assembly out to your left (the right side of the vehicle).

Figure 7-4. Ignition Switch

1. Socket head fastener (1), with spacer behind switch
2. Tamper-resistant Torx fasteners (2)
3. Throttle cables
4. Ignition switch as positioned on vehicle
5. Fork stop pin (retracted)
DISASSEMBLY

1. See Figure 7-5. Remove ignition switch housing (4) from ignition switch (5) by prying tabs on side of housing.
2. Remove ignition switch body fasteners (1). Separate ignition switch body (2) from ignition switch (5).

ASSEMBLY

NOTE
See Figure 7-5. In next step, be sure wide slot in ignition switch housing (4) is installed over wide boss on ignition switch (5).

1. Push ignition switch housing (5) on to ignition switch (4).

NOTE
In next step, do not force ignition switch (4) into ignition switch body (2). If ignition switch does not easily slide into ignition switch body, rotate slot in ignition switch body with screwdriver until proper installation can be achieved.

2. Mate ignition switch to ignition switch body.
3. Install ignition switch body fasteners (1). Tighten to 12-36 in-lbs (1.4-4.0 Nm).

Figure 7-5. Ignition Switch Assembly

Figure 7-6. Electrical Connectors Under Windscreen
NOTE

When installing the ignition switch it is important to have the fork lock pin pointing down while sliding the switch into place.

1. See Figure 7-4. While holding the throttle cables (3) to your left (the right side of the vehicle), slide the ignition switch assembly in to your right (the left side of the vehicle).

2. Install the ignition switch (4) with the fork stop pin (5) pointing down and, once in place, roll the assembly toward you and insert the fork stop pin into the upper triple clamp.

3. Attach ignition switch assembly to upper triple clamp using ignition switch fasteners (1, 2). Use LOCTITE 272 (Red) on fasteners. Tighten to 12-14 ft-lbs (16.3-19 Nm).

4. See Figure 7-7. Connect ignition switch connector [33] to wiring harness.

5. Install horn connectors [122] and install horn assembly tightening fastener to 72-96 in-lbs (8.1-10.8 Nm).

6. See Figure 7-6. Connect:
   ● Instrument cluster [39]
   ● Left [24] and right [22] handlebar wiring harnesses
   ● Turn signals [31]
   ● Turn signal flasher [30]

7. Loosely install cable strap around the main wiring harness and the ignition switch.

⚠️ WARNING

Always connect positive battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion resulting in personal injury.

8. Install negative battery cable to battery terminal. Tighten fastener to 60-96 in-lbs (6.8-10.8 Nm).

9. Check ignition switch for proper operation. If operation fails, reread procedure and verify that all steps were performed.

⚠️ WARNING

After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

10. Install seat. See 2.41 SEAT.

11. Install windscreen and tighten fasteners to 10-12 in-lbs (1.1-1.4 Nm).
GENERAL

Resistor-type high-tension spark plug cables have a carbon-impregnated fabric core, instead of solid wire, for radio noise suppression and improved reliability of electronic components. Use the exact replacement cable for best results.

REMOVAL

**WARNING**

Never disconnect a spark plug cable with the engine running. If you disconnect a spark plug cable with the engine running, you may receive a potentially fatal electric shock from the ignition system which could result in death or serious injury.

**CAUTION**

When disconnecting each spark plug cable from its spark plug terminal, always grasp and pull on the rubber boot at the end of the cable assembly (as close as possible to the spark plug terminal). Do not pull on the cable portion itself. Pulling on the cable will damage the cable's carbon core.

1. Remove airbox assembly. See 4.43 AIRBOX.
2. See Figure 7-8. Disconnect spark plug cables from ignition coil and spark plug terminals. Inspect cables for damage.

![Figure 7-8. Spark Plug Cable Location](image)
INSPECTION

1. Inspect spark plug cables. Replace cables that are worn or damaged.
   a. Check for cracks or loose terminals.
   b. Check for loose fit on ignition coil and spark plugs.
2. Check cable boots/caps for cracks or tears. Replace boots/caps that are worn or damaged.

   NOTE
   Both cables are the same length.
3. See Figure 7-9. Check spark plug cable resistance with an ohmmeter. Replace cables not meeting resistance specifications.

Table 7-10. Spark Plug Cables

INSTALLATION

   NOTES
   ● To ease installation, install spark plug cables to ignition coil first.
   ● See 1.14 SPARK PLUGS for spark plug information.
1. Connect spark plug cables to ignition coil and spark plugs. Fasten boots/caps securely. Tight connections provide the necessary moisture-proof environment for the ignition coil and spark plug terminals.
2. Install airbox assembly. See 4.43 AIRBOX.
GENERAL

The starter interlock system is designed to prevent unintended start-up and/or forward motion of the motorcycle with the vehicle's sidestand not retracted.

Two circuits make up the starter interlock system.

Starter Circuit

The starter circuit prevents the motorcycle from being started unless a ground has been established at the starter relay. This ground may come from one of two sources.

- By placing the motorcycle in neutral and grounding through the neutral switch.
- By disengaging the clutch and grounding through the clutch lever switch.

Once the starter circuit is grounded and the starter button pushed, the starter relay can be energized. The energized relay then permits the starter motor to crank the engine.

Ignition Circuit

The ignition circuit prevents the motorcycle from operating unless a ground is established at the ignition relay. If this ground is not established, the ignition system will be not turned on and the motorcycle will not run. Grounds may be established three ways.

- By retracting the sidestand and grounding through the sidestand switch.
- By placing the motorcycle in neutral and grounding through the neutral switch.
- By disengaging the clutch and grounding through the clutch lever switch.

Note that the ignition circuit allows operation in gear with the sidestand extended if the clutch is disengaged. However, if the motorcycle is in gear with the sidestand extended, and the clutch is released, the ignition ground is lost and the ignition system is turned off. This system will prevent vehicle operation if forward motion is attempted with the sidestand down.

Follow starter troubleshooting in Section 5.
The reference numbers below correlate with the circled numbers in the 7.5 STARTER INTERLOCK flow charts.

1. Check diode polarity as shown in Figure 7-10.
2. Check diode with an ohmmeter as shown in Figure 7-11.

**Figure 7-10. Diode Polarity**

**Figure 7-11. Ohmmeter Diode Test**

**Figure 7-12. Diode Wiring**
Ignition Test
CONDITION: Sidestand up and key ON, transmission in neutral and clutch engaged

Starter Test (Part 1 of 2)
CONDITION: Sidestand down, key ON, transmission in neutral and clutch engaged
Starter Test (Part 2 of 2)

CONDITION: Sidestand down, key ON, transmission in gear and clutch disengaged

Check for ground on TN/W wire of Diode 1. Ground present?

- YES
  - Repair open on TN/W wire between Diode 1 and ignition relay.

- NO
  - Check for ground on TN/GN wire of Diode 1. Ground present?

- YES
  - Check Diode 1 with ohmmeter. Diode OK?

  - YES
    - Diode installed backwards. Reverse polarity.
  
  - NO
    - Replace diode.

- NO
  - Check for ground on BK wire of connector [95]. Ground present?

  - YES
    - Replace clutch switch.

  - NO
    - Repair open on BK wire between connector [95] and ground.
Figure 7-13. Interlock Circuit

ECM [10] Pin 1 also provides power to fuel pump, both fuel injectors and coil.
Sidestand Switch

See Figure 7-14. The sidestand switch is a rotary type switch. The switch completes a path to ground for the ignition relay when the sidestand is in the retracted position. Test the switch as follows:

1. Remove heat shrink tubing from sidestand switch connector [60].
2. Unplug the 2-place sidestand switch connector [60].
3. Test the switch using an ohmmeter.
   a. With sidestand down (switch open), the switch should show $\infty$ ohms (infinite ohms).
   b. With sidestand up (switch closed), the switch should show 0 ohms or little resistance.
4. Replace the assembly with a new switch if necessary. See 2.43 SIDESTAND ASSEMBLY.
5. Replace heat shrink tubing.

Clutch Switch

See Figure 7-15. The clutch switch attaches to the clutch control lever bracket. The switch completes a path to ground for the ignition relay and the starter relay when the clutch is disengaged. Test the switch as follows:

1. Unplug the 2-place clutch switch connector [95].
2. Test the switch using an ohmmeter.
   a. With clutch engaged (1) (switch open), the switch should show $\infty$ ohms (infinite ohms).
   b. With clutch disengaged (2) (switch closed), the switch should show 0 ohms or little resistance.
3. Replace the assembly with a new switch if necessary. See 2.24 CLUTCH HAND LEVER.
Ignition Relay

The ignition relay is located under the seat. Test the relay as follows:

1. See Figure 7-16. Locate ignition relay (2) within relay block.
2. To test relay, proceed to Step 3. If installing a new starter relay, remove old relay. Install new relay into relay block.
3. See Figure 7-17. Obtain a 12 volt battery and a continuity tester or ohmmeter.
   a. Pull relay from relay block.
   b. Connect positive battery lead to the 86 terminal.
   c. Connect negative battery lead to the 85 terminal to energize relay.
   d. Check for continuity between the 30 and 87 terminals. A good relay shows continuity (continuity tester lamp “on” or a zero ohm reading on the ohmmeter). A malfunctioning relay will not show continuity and must be replaced.
4. Replace the relay with a new relay if necessary.

Key Switch Relay

See Figure 7-16. The key switch relay (1) is under the seat. See Ignition Relay under 7.5 STARTER INTERLOCK for testing procedure.

Battery Fuse

A 30 Amp battery fuse links the ignition key switch and the battery. The 30A battery fuse is located under the rider’s seat. See 7.23 BATTERY FUSE AND FUSES for more information.
Diodes

See Figure 7-18. The diodes are located in the fuse block under the seat.

1. See Figure 7-19. Locate diodes within fuse block.
2. Test diodes using Starter Test flow charts under DIAGNOSTICS.
3. Identify the diode which must be replaced. Replace both diodes if necessary.
4. Replace the diodes by pulling them straight out. The spare diode may be used in either circuit as long as it is installed in the correct direction.
GENERAL

The charging system consists of the alternator and regulator. Charging system circuits are shown in Figure 7-22.

CAUTION

Never install accessory wiring between battery post and battery cable. Installing wire between battery post and battery cable could cause damage to electrical system.

When installing electrical accessories, install longer battery post fasteners. Install wiring between battery cable and fastener.

Alternator

The alternator consists of two main components:

- The rotor which mounts to the engine sprocket shaft.
- The stator which bolts to the engine crankcase.

Voltage Regulator

See Figure 7-20. The voltage regulator is a series regulator with shunt control. The voltage regulator combines the functions of rectifying (converting AC voltage to DC) and regulating (controlling voltage output).

TROUBLESHOOTING

When the charging system fails to charge or does not charge at a satisfactory rate, check the following:

Battery

Check for a weak or dead battery. See 7.10 BATTERY. Battery must be fully charged in order to perform any electrical tests.

Wiring

Check for corroded or loose connections in the charging circuit. See Figure 7-22.

Voltage Regulator Inspection

See Figure 7-21. The plug connector to stator must be clean and tight.
Test 7.6 (Part 1 of 2)

SYMPTOM: BATTERY BECOMES DISCHARGED

Test battery. Charge or replace as required. See 7.10 BATTERY.

PASS

Test voltage regulator. See Voltage Regulator Bleed Test.

PASS

Perform Millampere Draw Test (If applicable).

FAIL

Replace regulator.

FAIL

Isolate damaged wiring or excessive accessories.

FAIL

Isolate damaged component or wiring.

FAIL

Correct as required.

PASS

Perform Total Current Draw Test. Record measurement.

PASS

STOP

Go to Test 7.6 (Part 2 of 2).

NOTE
Whenever a charging system component fails a test and is replaced, re-test the system to be sure the problem has been corrected.
Test 7.6 (Part 2 of 2)
SYMPTOM: BATTERY BECOMES DISCHARGED

From Test 7.6 (Part 1 of 2).
Perform Current and Voltage Output Test. Record measurement and compare with Total Current Draw Test before proceeding.

- **Pass**
  - Perform Voltage Output Test.
  - System tests good up to this point. Suspect:
    - Accessories on for long periods when vehicle is parked and not running.
    - Accessories on when vehicle is ridden very slowly for long periods.
    - Battery self-discharge and/or accessory draw because vehicle was not operated for a long period.
- **Fail**
  - Perform Stator Check.

- **Pass**
  - Replace regulator.
- **Fail**
  - Perform AC Output Check.
  - Replace stator.

- **Pass**
  - Replace regulator. Perform Current and Voltage Output Test.
- **Fail**
  - Inspect rotor.
  - System OK.
  - Damaged or slipping rotor.
  - Replace stator.
  - Replace rotor.

**NOTE**
Whenever a charging system component fails a test and is replaced, re-test the system to be sure the problem has been corrected.
Figure 7-22. Charging System Circuit
Voltage Regulator Bleed Test

NOTE
Stator connector [46] and regulator connector [77] are located under sprocket cover. For more information see 7.25 SPROCKET COVER WIRING.

1. Be sure regulator is connected to battery.
   a. Check that voltage regulator connector [77] halves are engaged.
   b. Check that main fuse is not blown.
2. Locate and disconnect stator connector [46].
3. Check regulator connector using a trouble light.
   a. Touch one probe to a suitable ground.
   b. Touch the other to the regulator pins, one at a time.
   c. If light glows, replace regulator.

Milliampere Draw Test

NOTE
Be sure accessories are not wired so they stay on at all times. This condition could drain battery completely if vehicle is parked for a long time. Check for this by connecting ammeter between negative battery terminal and battery.

1. See Figure 7-23. Connect ammeter between negative battery terminal and battery. With this arrangement, you will also pick up any regulator drain.
2. With ignition key switch turned to OFF and all lights and accessories off, observe amperage reading.
   a. Maximum reading should be 1.6 milliamperes.
   b. A higher reading indicates excessive current draw. Any accessories must be considered and checked for excessive drain.

NOTE
A battery with a surface discharge condition could suffer a static drain. Correct by cleaning battery case.

Total Current Draw Test

If battery runs down during use, the current draw of the motorcycle components and accessories may exceed output of the charging system.

WARNING
Always turn the battery load tester OFF before connecting tester cables to the battery terminals. Connecting tester cables with the load tester ON could cause a spark resulting in a battery explosion which could result in death or serious injury.

1. See Figure 7-24. To check for this condition, place load tester induction pickup or current probe pickup over battery negative cable.
2. Disconnect stator wiring from voltage regulator wiring at the connector [46] under front sprocket cover See 7.25 SPROCKET COVER WIRING. Start the motorcycle and run the engine at 2000 RPM.
3. With ignition and all continuously running lights and accessories turned on (headlight on high beam), read the total current draw.
4. Compare this reading to the reading obtained after performing the CURRENT AND VOLTAGE OUTPUT TEST.
   a. The current output should exceed current draw by 3.5 amps minimum.
   b. If output does not meet specifications, there may be too many accessories for the charging system to handle.
5. Reconnect regulator after testing.
Current and Voltage Output Test

1. Connect load tester.
   a. Connect negative and positive leads to battery terminals.
   b. See Figure 7-25. Place load tester induction pickup over positive regulator cable.

   **CAUTION**
   Do not leave any load switch turned on for more than 20 seconds or overheating and tester damage are possible.

2. Run the engine at 3000 RPM. Increase the load as required to obtain a constant 13.0 VDC.

3. The current output should be 34-38 amps. Make note of measurement for use in TOTAL CURRENT DRAW TEST.

   **NOTE**
   Rider’s habits may require output test at lower RPM.

Voltage Output Test

1. See Figure 7-25. After removing the load, read the load tester voltage meter.
   a. If voltage to the battery is not more than 15 VDC, voltage output is within specifications. Investigate other possible problems. See TROUBLESHOOTING in this section.
   b. If voltage is higher, regulator is not functioning properly or connections are loose or dirty.

Stator Check

1. Turn ignition key switch to OFF.
2. See Figure 7-26. Connect an ohmmeter.
   b. Insert one ohmmeter lead into a stator socket.
   c. Attach the other lead to a suitable ground.
3. Test for continuity with ohmmeter set on the RX1 scale.
   a. A good stator will show no continuity (∞ ohms) across all stator sockets and ground.
   b. Any other reading indicates a grounded stator which must be replaced.
4. See Figure 7-27. Remove ground lead. Check resistance across stator sockets 1-2, 2-3 and 3-1.
5. Test for resistance with ohmmeter set on the RX1 scale.
   a. Resistance across the stator sockets should be 0.1-0.3 ohms.
   b. If the resistance is lower, the stator is damaged and must be replaced.

   **NOTE**
   Verify that meter reads 0 ohms when probes are shorted together. If not, subtract lowest value to resistance value of stator.
AC Output Check

1. See Figure 7-28. Test AC output.
   b. Connect an AC voltmeter across stator sockets 1-2.
   c. Run the engine at 2000 RPM. The AC output should be 32-40 volts AC. (approximately 16-20 volts per 1000 RPM).
   d. Repeat test across stator sockets 2-3 and 1-3.

2. Compare test results to specifications.
   a. If the output is below specifications, charging problem could be a faulty rotor or stator.
   b. If output is good, charging problem might be faulty regulator/rectifier. Replace as required.

3. Check the output again as described under CURRENT AND VOLTAGE OUTPUT TEST on page 7-26.

Figure 7-27. Check for Stator Resistance

Figure 7-28. Check Stator AC Voltage Output
To protect against accidental start-up of vehicle, disconnect the negative battery cable before proceeding. Inadequate safety precautions could result in death or serious injury.

1. Disconnect negative battery cable.
2. Remove primary cover. See 6.2 PRIMARY CHAIN.
3. Remove clutch assembly, primary chain and engine sprocket/rotor assembly as a unit. See 6.4 PRIMARY DRIVE/CLUTCH.
4. Remove/disassemble rotor and/or stator, as required. Refer to the following procedures.

**Rotor**
1. See Figure 7-29. Remove the eight fasteners which secure alternator rotor to engine sprocket.
2. See Figure 7-30. Position blocking under rotor. Press sprocket free of rotor.

**Stator**
1. See Figure 7-31. Disconnect stator wiring (4) from voltage regulator wiring at connector (5) [46] under sprocket cover. See 7.25 SPROCKET COVER WIRING.
2. Remove cable straps holding stator wire to wire harness.

**CAUTION**

Stator TORX screws contain a thread locking compound. Do not reuse existing screws. Always use new screws with the proper thread locking compound. Loss of torque on TORX fasteners could result in alternator damage.

3. Remove and discard the four TORX screws (1) which secure stator (2) to left crankcase half.
4. Remove stator wiring grommet (3) from left crankcase half.
5. Withdraw stator wiring (4) from grommet hole in left crankcase half. Remove stator.
CAUTION

Do not strike or drop alternator rotor or damage to magnet adhesive may occur. Magnet adhesive damage can result in rotor failure.

1. Clean rotor with a petroleum-base solvent. Remove all foreign material from rotor magnets. Replace rotor if rotor magnets are cracked or loose.
2. Clean stator by wiping with a clean cloth.
3. Examine stator leads for cracked or damaged insulation.

NOTE
The rotor and stator can be replaced individually if either is damaged.

ASSEMBLY/INSTALLATION

Depending on whether the rotor, the stator, or both the rotor and stator were removed/disassembled, perform the applicable procedures which follow:

1. See Figure 7-31. Feed stator wiring (4) with attached grommet (3) into open grommet hole in left crankcase half.
2. Apply a light coating of clean engine oil or chaincase lubricant to grommet. Install grommet into hole in left crankcase half.

CAUTION
Stator TORX screws contain a thread locking compound. Do not reuse existing screws. Always use new screws with the proper thread locking compound. Loss of torque on TORX fasteners could result in alternator damage.

3. Position stator (2) on left crankcase half. Secure stator using four new TORX screws (1). Tighten TORX screws to 30-40 in-lbs (3-4 Nm).
4. Route stator wiring (4) behind rear cylinder and in front of transmission breather hose. See 7.25 SPROCKET COVER WIRING for remaining wire routing information.

Figure 7-32. Pressing Rotor onto Sprocket

5. See Figure 7-32. Attach rotor to sprocket.
   a. Position rotor (3) on sprocket (1). Align holes in sprocket with holes in rotor.
   b. Insert the new eight mounting fasteners through rotor and start fasteners into tapped holes in sprocket.
   c. Position a section of pipe (2) with an inside diameter larger than the sprocket mounting hub over center of rotor. Press rotor onto sprocket. Tighten fasteners to 90-110 in-lbs (10-12 Nm).
6. Install clutch assembly, primary chain and engine sprocket/rotor assembly as a unit. See 6.4 PRIMARY DRIVE/CLUTCH.
7. Install primary cover. See 6.2 PRIMARY CHAIN.
8. Connect negative battery cable.
9. Test charging system. See 7.6 CHARGING SYSTEM.
GENERAL

The voltage regulator is mounted to the front of the crankcase. The voltage regulator is not repairable. Replace the unit if it fails.

REMOVAL

1. Remove seat. See 2.41 SEAT.

**WARNING**

To protect against shock and accidental start-up of vehicle, disconnect the negative battery cable before proceeding. Inadequate safety precautions could result in death or serious injury.

2. Disconnect negative battery cable from battery.

**CAUTION**

When disconnecting the alternator stator wiring, pull apart the connector by firmly grasping both connector halves. Do not pull on leads or damage to the wires and/or terminals may result.

3. See Figure 7-34. Disconnect stator connector [46] (1) and voltage regulator connector [77] (2) located under sprocket cover. See 7.25 SPROCKET COVER WIRING.

4. Remove fasteners (5) and voltage regulator (4) from bracket (3).

INSTALLATION

1. See Figure 7-34. Attach new voltage regulator (4) to bracket (3). Tighten new fasteners (5) to 48-60 in-lbs (5.4-6.8 Nm).

2. Connect stator connector [46] (1) and voltage regulator connector [77] (2) located under sprocket cover. See 7.25 SPROCKET COVER WIRING.

3. Connect negative battery cable to battery terminal.

**WARNING**

After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

4. Install seat. See 2.41 SEAT.

5. Test charging system. See 7.6 CHARGING SYSTEM.
REMOVAL

**WARNING**

To protect against shock and accidental start-up of vehicle, disconnect the negative battery cable before proceeding. Inadequate safety precautions could result in death or serious injury.

**WARNING**

Always disconnect the negative battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

1. See Figure 7-35. Disconnect negative and positive cables from battery, negative cable first.
   a. Remove fastener holding negative cable to negative terminal.
   b. Remove fastener holding positive cable to positive battery terminal.

2. See Figure 7-36. Remove fastener to detach negative battery cable from frame.

3. See Figure 7-37. Remove protective rubber boot from starter fastener. Remove fastener with washer to detach positive battery cable from starter.

4. Cut 14 gauge Red/Yellow wire approximately 6 in. above the point where it enters the main harness bundle.

   **NOTE**
   
   This is to allow a splice to be made for the new positive cable to be installed.

INSTALLATION

1. Clean cable connectors and battery terminals using a wire brush or sandpaper to remove any oxidation.

**WARNING**

Always connect positive battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

**CAUTION**

Connect cables to correct terminals of battery or serious damage to motorcycle electrical system will occur.

2. Connect cables to battery.
   a. See Figure 7-35. Positive battery cable runs from starter to positive battery terminal.
   b. Splice 14 gauge Red/Yellow wire coming from positive battery cable into main harness bundle.
   c. Connect positive cable to positive (+) battery terminal using fastener.
   d. Connect negative cable to negative (-) battery terminal using fastener.
   e. Tighten terminal fasteners to 72-96 in-lbs (8-11 Nm).

![Figure 7-35. Battery](image)

![Figure 7-36. Negative Battery Cable](image)
3. Connect cables to frame and starter.
   a. See Figure 7-37. First, connect positive cable to starter using fastener with washer. Tighten fastener to 60-85 in-lbs (7-10 Nm).
   b. See Figure 7-36. Attach negative cable to frame. Tighten to 48-72 in-lbs (5.4-8.1 Nm).
4. Apply light coat of petroleum jelly or corrosion-retardant material to both battery terminals.

Figure 7-37. Positive Battery Cable
(Protective Boot Not Shown)
GENERAL

All Buell batteries are permanently sealed, maintenance-free, valve-regulated, lead/calcium and sulfuric acid batteries. The batteries are shipped pre-charged and ready to be put into service. Do not attempt to open these batteries for any reason.

WARNING

All batteries contain electrolyte. Electrolyte is a sulfuric acid solution that is highly corrosive and can cause severe chemical burns. Avoid contact with skin, eyes, and clothing. Avoid spillage. Always wear protective face shield, rubberized gloves and protective clothing when working with batteries. A warning label is attached to the top of the battery. See Figure 7-38. Never remove warning label from battery. Failure to read and understand all precautions contained in warning label before performing any service on batteries could result in death or serious injury.

Figure 7-39. Battery Warning Label
### Voltmeter Test

See Table 7-13. The voltmeter test provides a general indicator of battery condition. Check the voltage of the battery to verify that it is in a 100% fully charged condition. If the open circuit (disconnected) voltage reading is below 12.6V, charge the battery and then recheck the voltage after the battery has set for one to two hours. If the voltage reading is 12.8V or above, perform the load test.

#### Table 7-13. Voltmeter Test

<table>
<thead>
<tr>
<th>BATTERY CHARGE CONDITIONS</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>12.8</td>

<tr>
<td>11.8</td>
<td>0%</td>
</tr>
</tbody>
</table>

### Load Test

The load test measures battery performance under full current load and is the best indicator of battery condition. To load test the battery, proceed as follows:

1. Always fully charge the battery before testing or test readings will be incorrect. See BATTERY INSTALLATION AND CONNECTION. Load testing a discharged battery can also result in permanent battery damage.

2. After charging, allow battery to stand for at least one hour before testing.

3. Connect tester leads to battery posts and place induction pickup over negative (black) cable. See Figure 7-41.

### CAUTION

Load testing a discharged battery can result in permanent battery damage.

#### WARNING

Always turn the battery load tester OFF before connecting the tester cables to the battery terminals. Connecting tester cables with the load tester ON could cause a spark resulting in a battery explosion which could result in death or serious injury.

4. See Table 7-14. Load battery at 50% of CCA rating using the load tester. Voltage reading after 15 seconds should be 9.6V or more at 70° F. (21° C).

#### Table 7-14. Battery Load Test

</thead>
<tbody>
<tr>
<td>XB9S</td>
<td>200</td>
<td>100</td>
</tr>
</tbody>
</table>

### CAUTION

To avoid load tester and/or battery damage, do not leave the load tester switch turned ON for more than 20 seconds.

5. Install the battery on the motorcycle. See BATTERY INSTALLATION AND CONNECTION.
DISCONNECTION AND REMOVAL

1. Remove seat. See 2.41 SEAT.

**WARNING**

To protect against accidental start-up of vehicle, disconnect the negative battery cable before proceeding. Inadequate safety precautions could result in death or serious injury.

**WARNING**

Always disconnect the negative battery cable first. If the positive battery cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

2. Unthread fastener and remove battery negative cable (black) from battery negative (−) terminal.

3. Unthread fastener and remove battery positive cable (red) from battery positive (+) terminal.

4. Unhook battery strap from frame.

5. Remove battery.

CLEANING AND INSPECTION

1. Battery top must be clean and dry. Dirt and electrolyte on top of the battery can cause battery to self-discharge. Clean battery top with a solution of baking soda (sodium bicarbonate) and water (5 teaspoons baking soda per quart or liter of water). When the solution stops bubbling, rinse off the battery with clean water.

2. Clean cable connectors and battery terminals using a wire brush or sandpaper. Remove any oxidation.

3. Inspect the battery screws and cables for breakage, loose connections and corrosion. Clean clamps.

4. Check the battery posts for melting or damage caused by overtightening.

5. Inspect the battery for discoloration, raised top or a warped or distorted case, which might indicate that the battery has been frozen, overheated or overcharged.

6. Inspect the battery case for cracks or leaks.
BATTERY CHARGING

Safety Precautions

Never charge a battery without first reviewing the instructions for the charger being used. In addition to the manufacturer's instructions, follow these general safety precautions:

- Always wear proper eye, face and hand protection.
- Always charge batteries in a well-ventilated area.
- Turn the charger “OFF” before connecting the leads to the battery to avoid dangerous sparks.
- Never try to charge a visibly damaged or frozen battery.
- Connect the charger leads to the battery; red positive (+) lead to the positive (+) terminal and black negative (–) lead to the negative (–) terminal. If the battery is still in the vehicle, connect the negative lead to the chassis ground. Be sure that the ignition and all electrical accessories are turned off.
- Make sure that the charger leads to the battery are not broken, frayed or loose.
- If the battery becomes hot, or if violent gassing or spewing of electrolyte occurs, reduce the charging rate or turn off the charger temporarily.
- Always turn the charger “OFF” before removing charger leads from the battery to avoid dangerous sparks.

Charging Battery

Charge the battery if any of the following conditions exist:

- Vehicle lights appear dim.
- Electric starter sounds weak.
- Battery has not been used for an extended period of time.

1. Perform a voltmeter test to determine the state of charge. See BATTERY TESTING. If battery needs to be charged, proceed to step 2.

2. Remove the battery from the motorcycle. See DISCONNECTION AND REMOVAL. Place the battery on a level surface.

CAUTION

Always remove the battery from the motorcycle before charging. Accidental electrolyte leakage will damage motorcycle parts.

3. Connect the red battery charger lead to the positive (+) terminal of the battery.

4. Connect the black battery charger lead to negative (-) terminal of the battery.

NOTE

If the battery is still in the vehicle, connect the negative lead to the chassis ground. Be sure that the ignition and all electrical accessories are turned off.

5. Step away from the battery and turn on the charger. See the charging instructions in Table 7-15.

6. After the battery is fully charged, disconnect the black battery charger lead to the negative (–) terminal of the battery.

7. Disconnect the red battery charger lead to the positive (+) terminal of the battery.

8. Mark the charging date on the battery.

9. Perform a load test to determine the condition of the battery. See BATTERY TESTING.

</tbody>
</table>

The figures listed above assume that the battery is charging at room temperature. If warmer than room temperature, use a slightly shorter charging time. If colder, use a slightly longer charging time.

The use of constant current chargers to charge sealed maintenance-free batteries is not recommended. Any overcharge will cause dry-out and premature battery failure. If a constant current charger is the only type available, do not exceed the charge times listed above and do not continue charging the battery if it gets hot. When charging, never exceed 15 volts for more than 30 minutes.
BATTERY CABLE ROUTING

Positive battery cable runs from starter post to positive battery terminal. Negative battery cable runs from frame to negative battery terminal. See Figure 7-41.

BATTERY INSTALLATION AND CONNECTION

1. Place the fully charged battery into the battery box, terminal side up.

**CAUTION**

Connect the cables to the correct battery terminals or damage to the motorcycle electrical system will occur.

**WARNING**

Always connect the positive battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

**CAUTION**

Overtightening fasteners can damage battery terminals.

2. Insert fastener through battery positive cable (red) into threaded hole of battery positive (+) terminal. Tighten fastener to 72-96 in-lbs (8-11 Nm).

3. Insert fastener through battery negative cable (black) into threaded hole of battery negative (-) terminal. Tighten fastener to 72-96 in-lbs (8-11 Nm).

4. Apply a light coat of petroleum jelly or corrosion retardant material to both battery terminals.

5. Install battery strap.

**WARNING**

After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

6. Install seat. See 2.41 SEAT.
WARNING

Always store batteries where they cannot be reached by children. Contact with the battery’s sulfuric acid could result in death or serious injury.

CAUTION

The electrolyte in a discharged battery will freeze if exposed to freezing temperatures. Freezing may crack the battery case and buckle battery plates.

If the motorcycle will not be operated for several months, such as during the winter season, remove the battery from the motorcycle and fully charge. See BATTERY CHARGING.

Self-discharge is a normal condition and occurs continuously at a rate that depends on the ambient temperature and the battery’s state of charge. Batteries discharge at a faster rate at higher ambient temperatures. To reduce the self-discharge rate, store battery in a cool (not freezing), dry place. See Figure 7-42.

Charge the battery every month if stored at temperatures below 60˚ F. (16˚ C). Charge the battery more frequently if stored in a warm area above 60˚ F. (16˚ C).

NOTE

The H-D Battery Tender Automatic Battery Charger (P/N 99863-93TA) may be used to maintain battery charge for extended periods of time without risk of overcharging or boiling.

When returning a battery to service after storage, refer to the instructions under BATTERY CHARGING.

Figure 7-42. Battery Self-Discharge Rate
The XB9S uses dual headlights with replaceable bulbs.

- High beam headlight is located on the left side of vehicle and turns on and off with headlight switch.
- Low beam headlight is located on the right side of vehicle.
- Adjustment of individual headlight projection is accomplished by adjusting the entire headlight assembly.

For information on headlight housing and bracket disassembly/assembly see 2.25 HEADLIGHT ASSEMBLY AND SUPPORT BRACKET.

**NOTE**

Low beam does not remain on when high beam is activated. Only one headlight remains on at any given time unless the passing lamp switch is depressed while low beam is activated causing the high beam to temporarily flash.
Removal
1. Remove seat. See 2.41 SEAT.

**WARNING**
To protect against accidental start-up of vehicle, disconnect the negative battery cable before proceeding. Inadequate safety precautions could result in death or serious injury.

1. Disconnect negative battery cable.

**CAUTION**
The bulb contains Halogen gas under pressure. Handle bulb carefully and wear eye protection. Failure to follow adequate safety precautions could result in minor or moderate injury.

Never touch the bulb with your fingers. Fingerprints will etch the glass and cause the bulb to fail. Always wrap the bulb in paper or a clean, dry cloth during handling.

2. See Figure 7-43. Remove rubber boot from headlight housing.
3. Unplug headlight bulb connectors (3) and/or (4).
4. Release bulb holder (2) from headlight housing clips.
5. Pull bulb housing from headlight housing.

Installation

**NOTE**
Not using the specified bulb may cause charging system problems.

**CAUTION**
The bulb contains Halogen gas under pressure. Handle bulb carefully and wear eye protection. Failure to follow adequate safety precautions could result in minor or moderate injury.

Never touch the bulb with your fingers. Fingerprints will etch the glass and cause the bulb to fail. Always wrap the bulb in paper or a clean, dry cloth during handling.

1. See Figure 7-43. Align tabs on bulb (5) with tabs on headlight (1). Insert bulb.
2. Close the bulb holder (2).
3. Connect the headlight bulb connector.
4. Install rubber boot.
5. Connect negative battery cable.

**WARNING**
Check for proper headlight operation before riding motorcycle. Visibility is a major concern for motorcyclists. Failure to have proper headlight operation could result in death or serious injury.

6. See Figure 7-44. Check headlight for proper operation. If operation fails, reread procedure and verify that all steps were performed.
   a. Turn ignition key switch to ON.
   b. Check headlight LOW (3) and HIGH beam (2) settings.
   c. Set headlight to LOW beam. Press passing lamp switch (1). Headlight should flash HIGH beam for as long as the switch is pressed.
   d. Turn ignition key switch to OFF.
7. Align headlight. See 1.18 HEADLIGHTS.

**WARNING**
After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

Install seat. See 2.41 SEAT.
REMOVAL/DISASSEMBLY

1. See Figure 7-45. Remove two screws (2) to detach tail light lens (4) and tail light (5). If replacing bulb (3), turn counterclockwise and remove.
2. Remove seat. See 2.41 SEAT.
3. Disconnect three connectors [93] from tail lamp harness (6).

ASSEMBLY/INSTALLATION

1. See Figure 7-45. Attach the three tail light harness connectors [93] (7).
2. If removed, install tail lamp bulb (3).
   a. Turn bulb clockwise to install.
   b. Install tail light lens (4) and tail light (5) with two fasteners (2).
3. Check tail lamp for proper operation. If operation fails, reread procedure and verify that all steps were performed.
   a. Turn ignition key switch to ON.
   b. Check for tail lamp illumination.
   e. Turn ignition key switch to OFF.

WARNING

Check for proper tail lamp operation before riding motorcycle. Visibility is a major concern for motorcyclists. Failure to have proper tail lamp operation could result in death or serious injury.

After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

4. Install seat. See 2.41 SEAT.
REMOVAL/DISASSEMBLY

1. Remove seat. See 2.41 SEAT.
2. See Figure 7-46. Disconnect the two connectors [45] from license plate lamp harness (2).
3. Remove two jam nuts and washers (1) to detach license plate lamp from center tail section (3).
4. Pull the lamp assembly away from center tail section pulling the harness out between the tail screen and the center tail section.

NOTE
See Figure 7-47. If replacing bulb only, remove both lamp lens screws (3), remove lamp lens (5) and remove bulb (4). Replace bulb and install lens and tighten screws.

ASSEMBLY/INSTALLATION

1. See Figure 7-46. Install license plate lamp assembly.
   a. Insert license plate lamp wiring harness (2) through hole at rear of center tail section (3) and route between the tail section and the tail screen (4).
   b. Attach lamp assembly to tail section using washers and jam nuts (1) and tighten to 12-36 in-lbs (1.4-4.1 Nm).
   c. Attach the two connectors [45] from license plate lamp harness (2) to main harness.
2. Check lamp for proper operation. If operation fails, reread procedure and verify that all steps were performed.
   a. Turn ignition key switch to ON.
   b. Check for license plate lamp illumination.
   c. Turn ignition key switch to OFF.

WARNING
After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

3. Install seat. See 2.41 SEAT.
REMOVAL

NOTE
To ensure correct installation, make note of wire routing and cable strap locations before removing turn signals.

Bulbs
Remove screw on back of housing to access turn signal bulbs.

Front
1. Remove windscreen. See 2.40 FRONT WINDSCREEN.
2. See Figure 7-48. Disconnect bullet connectors on turn signal wires.
3. See Figure 7-49. Remove jam nut and lockwasher (2) from inside of front module (3).
4. Pull bullet connectors and wiring through hole in front module (3) and remove turn signal (1).

\[\text{Figure 7-48. Front Turn Signal Connections}\]

\[\text{Figure 7-49. Front Turn Signals}\]
Rear

1. Remove seat See 2.41 SEAT.
2. See Figure 7-50. Disconnect bullet connectors [18] & [19] on turn signal wires.
3. See Figure 7-51. Remove fastener and lockwasher (4).

**NOTE**
In next step, reflector bracket (3) will be removed with turn signal (1).

4. Remove turn signal from center tail section (5).

---

**Figure 7-50. Rear Turn Signal Connections**

**Figure 7-51. Rear Turn Signals**

1. Turn signal (2)
2. Turn signal bulb
3. Reflector bracket
4. Jam nut and lockwasher (2)
5. Center tail section
Front
1. See Figure 7-49. Insert bullet connectors and wiring through hole in front module.
2. Install turn signal using lockwasher and jam nut. Tighten fastener to 25-28 in-lbs (2.8-3.2 Nm).

![Figure 7-52. Front Turn Signal Connections](image)

3. Attach bullet connectors on turn signal wires as shown in Figure 7-53.

⚠️ **WARNING**

Check for proper turn signal operation before riding motorcycle. Visibility is a major concern for motorcyclists. Failure to have proper turn signal operation could result in death or serious injury.

4. Check turn signals for proper operation. If operation fails, reread procedure and verify that all steps were performed.
   a. Turn ignition key switch to ON.
   b. Activate left turn signals using switch on left handlebar. Front and rear left turn signals must flash.
   c. Activate right turn signals using switch on left handlebar. Front and rear right turn signals must flash.
   d. Turn ignition key switch to OFF.
5. Install windscreen. See 2.40 FRONT WINDSCREEN.

Rear
1. See Figure 7-53. Insert bullet connectors through center tail section.
2. Install reflector bracket.

**NOTE**
Be sure tab on turn signal fits into hole in reflector bracket and tab on reflector bracket fits into hole in enter tail section.

3. See Figure 7-51. Attach turn signal using lockwasher and fastener (4). Tighten fastener to 25-28 in-lbs (2.8-3.2 Nm).

![Figure 7-53. Rear Turn Signal Connections](image)

4. Attach bullet connectors on turn signal wires as shown in Figure 7-53.

⚠️ **WARNING**

Check for proper turn signal operation before riding motorcycle. Visibility is a major concern for motorcyclists. Failure to have proper turn signal operation could result in death or serious injury.

5. Check turn signals for proper operation. If operation fails, reread procedure and verify that all steps were performed.
   a. Turn ignition key switch to ON.
   b. Activate left turn signals using switch on left handlebar. Front and rear left turn signals must flash.
   c. Activate right turn signals using switch on left handlebar. Front and rear right turn signals must flash.
   d. Turn ignition key switch to OFF.

⚠️ **WARNING**

After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

6. Install seat. See 2.41 SEAT.
REMOVAL

NOTE
The turn signal flasher is not repairable. Replace flasher upon failure.

1. Remove windscreen. See 2.40 FRONT WINDSCREEN.
2. Remove fastener securing turn signal flasher to front module.
3. See Figure 7-54. Detach 3-place connector [30] from flasher body.

INSTALLATION

1. See Figure 7-54. Attach 3-place connector [30] to flasher.
2. Install turn signal to front module. Tighten fastener to 12-36 in-lbs (1.4-4.1 Nm).

WARNING
Check for proper turn signal operation before riding motorcycle. Visibility is a major concern for motorcyclists. Failure to have proper turn signal operation could result in death or serious injury.

3. Check turn signals for proper operation. If operation fails, reread procedure and verify that all steps were performed.
   a. Turn ignition key switch to ON.
   b. See Figure 7-55. Activate left turn signals using switch on left handlebar. Front and rear left turn signals must flash.
   c. Activate right turn signals using switch on left handlebar. Front and rear right turn signals must flash.
   d. Turn ignition key switch to OFF.
4. Install windscreen. See 2.40 FRONT WINDSCREEN.
REMOVAL

NOTE
The individual handlebar switches are not repairable. Replace switch assembly upon switch failure.

Right Side
1. Remove throttle cables. See 2.23 THROTTLE CONTROL.
3. Detach brake switch connector [121].

Left Side
1. Remove left switch housing mounting fasteners.
2. Unplug the clutch switch [95].

Figure 7-56. Right Handlebar Switch Connection

Figure 7-57. Left Handlebar Switch Connection
### INSTALLATION

#### Right Side

1. Attach throttle cables to hand control. See 2.23 THROTTLE CONTROL.

2. Install right switch housing.
   a. Position housing on right handlebar by engaging alignment pin on front housing with hole in handlebar.
   b. Attach switch housing with two mounting fasteners and tighten to 25-33 in-lbs (3-4 Nm).

3. Attach brake switch connector [121].

4. Attach right handlebar switch connector [22] to wire harness. See D.1 HOSE AND WIRE ROUTING for wire routing information.

![Figure 7-58. Right Handlebar Switch Connection](image)

#### WARNING

Check all handlebar switch operations before riding motorcycle. Visibility is a major concern for motorcyclists. Handlebar switches not operating properly could result in death or serious injury.

5. Check handlebar switch for proper operation. If operation fails, reread procedure and verify that all steps were performed.
   a. Turn ignition key switch to ON.
   b. Set ENGINE STOP SWITCH to RUN.
   c. Start motorcycle.
   d. Turn ignition key switch to OFF.

6. Turn ignition key switch to OFF.
Left Side

1. Install left switch housing.
   a. Position housing on left handlebar by engaging alignment pin on front housing with hole in handlebar.
   b. Attach switch housing with three mounting fasteners and tighten to 25-33 in-lbs (3-4 Nm).

2. Connect clutch switch [95].

**WARNING**

Check all handlebar switch operations before riding motorcycle. Visibility is a major concern for motorcyclists. Handlebar switches not operating properly could result in death or serious injury.

4. Check handlebar switch for proper operation. If operation fails, reread procedure and verify that all steps were performed.
   a. Turn ignition key switch to ON.
   b. Check headlight LOW and HIGH beam settings.
   c. Set headlight to LOW beam. Press passing lamp switch. Headlight should flash HIGH beam for as long as the switch is pressed.
   d. Check left and right turn signals.
   e. Activate horn by pressing horn switch.

---

**Figure 7-59. Left Handlebar Switch Connection**
REMOVAL

1. See Figure 7-60. Remove fastener (1) to detach vehicle speed sensor (2) from crankcase.
2. Remove cable strap (4).
3. Disconnect 3-place Deutsch connector [65] under sprocket cover. See 7.25 SPROCKET COVER WIRING.

INSTALLATION

1. See Figure 7-60. Install fastener (1) to attach vehicle speed sensor (2) to crankcase.
2. Connect vehicle speed sensor connector [65] to wiring harness. See 7.25 SPROCKET COVER WIRING.
3. Install cable strap (4).
GENERAL

Replace the instrument module if the unit is not working properly or if a lamp is inoperative. The module is not repairable. However, before replacing a component, check that the problem is not caused by a loose wire connection.

REMOVAL

1. WARNING
2. WARNING
To protect against shock and accidental start-up of vehicle, disconnect the negative battery cable before proceeding. Inadequate safety precautions could result in death or serious injury.
1. Remove seat. See 2.41 SEAT.
2. Disconnect negative battery cable.
3. Remove windscreen. See 2.40 FRONT WINDSCREEN.
4. See Figure 7-63. Disconnect instrument module connector [39].
5. See Figure 7-64. Remove fasteners (5) and washers (4).
6. Pull instrument module (2) from front support module (1).

INSTALLATION

1. See Figure 7-64. Place instrument module (2) into position in front support module (1).
2. Install washers (4) and fasteners (5). Tighten fasteners to 12-36 in-lbs (1.4-4.1 Nm).
3. See Figure 7-63. Connect instrument module connector [39].
4. Install windscreen. See 2.40 FRONT WINDSCREEN.
5. Install negative battery cable.

WARNING

After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

6. Install seat. See 2.41 SEAT.
GENERAL

See Figure 7-65. Use the SPEEDOMETER TESTER (Part No. HD-41354) for speedometer diagnostics. These diagnostics may include:

- Checking speedometer operation.
- Testing speedometer needle sweeping action.

The tester generates a simulated speedometer sensor signal. This signal aids in determining whether speedometer replacement is necessary. It can also be used to simulate running engine conditions for ignition system troubleshooting.

NOTES

- Use the following procedures in conjunction with the manual supplied with the speedometer tester.
- Test results may be inaccurate if tester battery is low.

TESTING

**NOTE**
The SPEEDOMETER TESTER (Part No. HD-41354) cannot be used to verify the calibration of a speedometer and it will not verify the speedometer’s function to support legal proceedings. It’s purpose is to verify speedometer function when performing service diagnosis or repair. It can also assist in determining if speedometer replacement is necessary.

**Speedometer Operation Test**

**NOTE**
For information on the correct routing of vehicle speed sensor wiring see 7.25 SPROCKET COVER WIRING.

1. See Figure 7-66. Locate the 3-place vehicle speed sensor connector [65] under the sprocket cover. See 2.31 SPROCKET COVER.
2. Place speedometer tester power switch in the ON position. Place signal switch in the OUT position.
3. Turn vehicle ignition switch ON.
   a. Press ENTER on the tester keypad.
   b. Enter a frequency from Table 7-16. Note that different markets use different frequencies.
   c. Verify that speedometer display reads the corresponding speed. To change the test frequency, press CLEAR to cancel and enter the new frequency. Press ENTER to begin and reverify.

**NOTE**
The speedometer should be accurate within 0-5 MPH (0-8 KPH).

**Table 7-16. Speedometer Test Frequency in Hertz (Hz)**

**Speedometer Needle Sweep Test**

The tester’s sweep function moves the speedometer needle through the full range of movement. This allows for testing the smoothness of operation and checking for hesitancy or a stuck needle.

1. See Figure 7-66. Disconnect vehicle speed sensor connector [65]. Attach speedometer tester connector to vehicle speed sensor connector.
2. Place speedometer tester power switch in the ON position. Place signal switch in the OUT position.
3. Turn vehicle ignition switch ON.
4. Begin test by pressing 0 on the tester keypad, then pressing ENTER. The tester will scan for two seconds, then the tester will put out a 1 Hz signal.
5. Select a test range.
   a. Press 2 to select LO range (1-20 Hz).
   b. Press 5 to select CEN range (21-999 Hz).
   c. Press 8 to select HI range (1000-20,000 Hz).
6. After selecting a range, use the corresponding arrow keys to accelerate through the range. As you move through the speed range, check for smooth needle movement.
   a. If testing LO range, press 1 or 3.
   b. If testing CEN range, press 4 or 6.
   c. If testing HI range, press 7 or 9.

**Speedometer Sensor Test**

If the speedometer is inoperative, but backlighting and odometer work, the speedometer sensor may not be working.

See Figure 7-67. Fabricate a test harness using the following parts. This harness can also be used to test the tachometer.

- Two Deutsch 3-place socket housings (Part No. 72113-94BK) and six socket terminals (Part No. 72191-94).
- Deutsch 3-place pin housing (Part No. 72103-94BK) and three pin terminals (Part No. 72080-99Y).
- Six lengths of 18 gauge wire, each 6.0 in. (15 cm) long.
- Test for voltage to sensor by checking for 4.5-5.5 VDC on red wire in connector [65].
- Then check for continuity to ground on black wire in connector [65].

1. Install the test harness between the vehicle speed sensor connector halves [65].
2. Raise rear wheel off floor using REAR WHEEL SUPPORT STAND (Part No. B-41174).
3. Place speedometer tester power switch in the ON position. Place signal switch in the IN position.
4. Plug the speedometer tester into the test harness. Turn vehicle ignition switch ON.
5. Press ENTER on the tester keypad.
6. Rotate the motorcycle’s rear wheel.
   a. If reading on speedometer tester changes as wheel is rotated, speedometer sensor is OK.
   b. If reading does not change, vehicle speed sensor is suspect. Install a known, good vehicle speed sensor and test again.
Speedometer Test: Chart 1

ODOMETER, TRIP ODOMETER AND RESET SWITCH TESTING

Turn ignition ON. Does odometer display consist of correct numbers?

YES

Press trip mode switch. Does display toggle between trip and odometer modes?

YES

Verify trip display consists of correct numbers. Are correct numbers displayed?

YES

Press reset for 5 seconds. Does trip odometer reset to zero?

STOP

NO

Replace instrument module.

NO

Replace instrument module.

NO

Replace instrument module.

GO TO

Go to Speedometer Test: Chart 2A.
Problem #2: Speedometer inoperative, reading high/low, or needle sticking/intermittent/erratic.
Check Accessory Fuse. Fuse OK? No, replace Fuse. Yes, Turn ignition ON. Is speedometer backlighting on?

YES

Hook up speedometer tester. See TESTING. Verify that tester battery is OK.

NO

If speedometer backlighting is not on, check for 9-12 VDC on O/W wire at terminal on back of speedometer. Voltage present?

YES

Perform speed sweep function and specified inputs with tester and observe output speed and odometer/trip odometer change on speedometer.

NO

If speedometer backlighting is not on, check for 9-12 VDC on O/W wire at terminal on back of speedometer. Voltage present?

YES

Does speedometer appear to function normally and follow sweeping frequency input?

NO

Check 3-pin vehicle speed sensor connector and wires for damage. Connector or wire damage found?

YES

Program steady input frequency on tester and observe output speed on speedometer while moving/shaking vehicle harness connections. Output erratic?

NO

Replace instrument module.

YES

Locate and repair open in O/W wire.

NO

Replace instrument module.

YES

Check 3-pin vehicle speed sensor connector and wires for damage. Connector or wire damage found?

NO

Program steady input frequency on tester and observe output speed on speedometer while moving/shaking vehicle harness connections. Output erratic?

YES

Bad connection found. Repair connector or harness.

NO

Check 3-pin vehicle speed sensor connector and wires for damage. Connector or wire damage found?

YES

Program steady input frequency on tester and observe output speed on speedometer while moving/shaking vehicle harness connections. Output erratic?

NO

Repair as necessary.

DIAGNOSTIC NOTES

- Low battery voltage on speedometer tester may cause inaccurate test results. Make sure speedometer tester battery is fully charged.
- If necessary, remove vehicle speed sensor and check for accumulation of debris. If debris is not present, replace sensor. If debris is present, clean sensor and repeat test. Replace if necessary.
INOPERATIVE, INACCURATE OR ERRATIC SPEEDOMETER

Continued from Speedometer Test: Chart 2A.
Check for 4-6 VDC on R/W wire in vehicle speed sensor connector [65B]. Voltage present?

YES

Check for continuity to ground on BK wire in connector [65B]. Continuity present?

YES

Check for voltage on W wire in connector [65B]. While connected, meter should read 4-6 VDC when gear tooth absent and 0-1 VDC when gear tooth present. Does it?

NO

Check for open/grounded wires. Wires OK?

YES

Replace instrument module.

NO

Repair wires.

YES

Check instrument module power (O/W wire) and ground terminal (BK wire) voltage at back of instrument module. Test voltage while shaking harness. Does voltage fluctuate?

NO

4-6 VDC is not present. Replace instrument module

YES

Check for spark plug wire terminals properly seated onto spark plugs and secondary coil terminals. Check for wear points on spark plug wires where insulation may be damaged. Does damage exist?

YES

Repair as necessary.

NO

Check speedometer speed sensor. Clean or replace sensor as required. Retest. Problem solved?

YES

System OK.

NO

Replace instrument module.
GENERAL

NOTE
Tachometer performance check can also be performed using DIGITAL TECHNICIAN (Part No. HD-44750).

See Figure 7-65. Use the SPEEDOMETER TESTER (Part No. HD-41354) for tachometer diagnostics. These diagnostics may include:

- Checking tachometer operation.
- Testing tachometer needle sweeping action.

The tester can be connected to the vehicle's cam position sensor connector. This connection introduces a signal to the ignition module that simulates the signal from the cam position sensor. The ignition module will use this simulated signal to open and close circuits to fire the spark plugs. This allows you to simulate the engine running and therefore generate tachometer readings.

TESTING

Operation Test

NOTE
For information on the correct routing of speedometer sensor wiring see 7.25 SPROCKET COVER WIRING.

1. See Figure 7-68. Locate the 3-place cam position connector [14] under the sprocket cover. See 2.31 SPROCKET COVER.

2. See Figure 7-69. Connect the speedometer tester to the cam position sensor Deutsch socket housing using test harness. See Speedometer Sensor Test under 7.19 SPEEDOMETER PERFORMANCE CHECK for more information on test harness.

3. Convert the desired test RPM to a tester frequency in Hertz. Several conversions are listed in Table 7-17.
   a. Select a desired tachometer reading for testing. This example will use 2000 RPM.
   b. Divide the desired tachometer reading by 60. For example, 2000/60=33.3.

NOTE
All tachometer accuracy tolerances were taken at 68 °-77 °F (20-25 °C).

4. Enter the result (33.3 for 2000 RPM) into the speedometer tester.
   a. The tachometer should respond by moving its needle to the desired RPM.
   b. Test the tachometer at several different RPM readings to verify proper operation.

<table>
<thead>
<tr>
<th>READING</th>

</tr>
</tbody>
</table>
Sweep Test

1. See Figure 7-69. Connect the speedometer tester to the cam position sensor Deutsch socket housing using test harness. See Speedometer Sensor Test under 7.19 SPEEDOMETER PERFORMANCE CHECK for more information on test harness.

2. Place speedometer tester power switch in the ON position. Place signal switch in the OUT position.

3. Turn vehicle ignition switch ON.

4. Begin test by pressing 0 on the tester keypad, then pressing ENTER. The tester will scan for two seconds, then the tester will put out a 1 Hz signal.

5. Select a test range.
   a. Press 2 to select LO range.
   b. Press 5 to select CEN range.
   c. Press 8 to select HI range.

6. After selecting a range, use the corresponding arrow keys to accelerate through the range. As you move through the speed range, check for smooth needle movement.
   a. If testing LO range, press 1 or 3.
   b. If testing CEN range, press 4 or 6.
   c. If testing HI range, press 7 or 9.

![Figure 7-69. Testing Tachometer](image)
GENERAL

The horn is located behind windscreen.

REMOVAL

1. Remove seat. See 2.41 SEAT.

WARNING

To protect against shock and accidental start-up of vehicle, disconnect the negative battery cable before proceeding. Inadequate safety precautions could result in death or serious injury.

2. Disconnect negative battery cable.

3. Remove headlight support bracket. See 2.25 HEADLIGHT ASSEMBLY AND SUPPORT BRACKET.

4. See Figure 7-70. Remove fastener (3).

5. Remove horn (1) from fairing support bracket (4).

6. See Figure 7-71. Detach Y/BK power wire and BK ground wire from terminal clips on horn.

INSTALLATION

1. See Figure 7-71. Connect Y/BK power wire and BK ground wire to terminal clips on horn.

2. See Figure 7-70. Attach horn (1) to fairing support bracket (4) using fastener (3). Tighten to 72-96 in-lbs (8.1-10.8 Nm).

3. Check horn operation. If horn does not sound or fails to function satisfactorily, see TROUBLESHOOTING.
   a. Turn ignition key switch ON.
   b. Press horn switch to activate horn.
   c. Turn ignition key switch OFF.

4. Install negative battery cable.

WARNING

After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

5. Install seat. See 2.41 SEAT.
TROUBLESHOOTING

1. If the horn does not sound or fails to function satisfactorily, check for the following conditions:
   a. Discharged battery.
   b. Loose, frayed or damaged wiring leading to horn terminal.

2. If battery has a satisfactory charge and wiring appears to be in good condition, test horn grounds and switch using voltmeter.
   a. See Figure 7-71. Remove Y/BK power and BK ground wires from terminal clips.
   b. Connect voltmeter positive (+) lead to Y/BK wire.
   c. Connect voltmeter negative (−) lead to ground.
   d. Turn ignition key switch ON.

3. See Figure 7-72. Depress horn switch and observe voltmeter reading.
   a. If battery voltage is present, horn or horn grounding is faulty. If horn is faulty, replace unit as an assembly. The horn is not repairable.
   b. If battery voltage is not present, either horn switch or wiring to horn is faulty. If horn switch is faulty, replace left handlebar switch. See 7.16 HANDLE-BAR SWITCHES.
GENERAL

See Figure 7-73. The neutral indicator switch (2) is threaded into the transmission portion of the right crankcase half. It is immediately forward of the transmission sprocket (1). The sprocket cover must be removed to test the switch.

A pin on the shifter drum contacts the neutral indicator switch plunger, completing the neutral indicator circuit. The switch is not repairable. Replace the switch if it malfunctions.

TESTING

1. Remove sprocket cover. See 2.31 SPROCKET COVER.

2. See Figure 7-73. Disconnect wire lead from neutral indicator switch (2).

3. Turn ignition key switch to ON. Touch the neutral indicator wire lead to a suitable ground.
   a. If indicator lamp lights, then problem is at indicator switch. Replace switch.
   b. If indicator lamp does not light, then problem is elsewhere in circuit. Check for loose connections, burned out indicator lamps or faulty wiring.
   c. After testing and repair, connect wire lead to indicator switch.

4. Install sprocket cover. See 2.31 SPROCKET COVER.

REMOVAL/INSTALLATION

1. Verify that the ignition key switch is turned to OFF.

2. Remove sprocket cover. See 2.31 SPROCKET COVER.

   NOTE
   If replacing neutral indicator switch wiring, see 7.25 SPROCKET COVER WIRING for correct wire routing.

3. See Figure 7-74. Remove wire lead (1) from neutral indicator switch (2).

4. Remove neutral indicator switch and washer (3).

5. Install new neutral indicator switch.
   a. Apply a light coating of LOCTITE Ex 243 (blue) to new neutral indicator switch (2) threads.
   b. Install washer (3) over neutral indicator switch (2) threads.
   c. Install switch in crankcase. Tighten switch to 36-60 in-lbs (4-6.8 Nm).
   d. Connect wire lead (1) to switch.

6. Install sprocket cover. See 2.31 SPROCKET COVER.
GENERAL

Buell motorcycles feature two components which protect the electrical system.

Fuses

The covered fuse block is under the seat.

See Figure 7-75. The lights, key switch, brake/horn and ignition fuses are rated at 15 amps. The ECM, cooling fan and accessory fuses are rated at 7.5 amps.

Always investigate the cause of blown fuses before replacing them.

Battery Fuse

See Figure 7-76. The 30 amp battery fuse is located under the seat.

To disable the motorcycle’s ignition system, pull the battery fuse up and out of the fuse block.
GENERAL

The main wire harness runs from the front of the motorcycle to the tail section.
Always replace plastic tree fasteners when replacing main wire harness. Remove tree fasteners carefully, do not leave any of fastener in frame.

REMOVAL

NOTES
- To ensure correct installation, make note of wire routing and cable strap locations before removing main wire harness.
- Main wire harness is removed from rear of vehicle through fan section of frame.

1. Remove seat. See 2.41 SEAT.
2. Remove airbox cover. See 4.43 AIRBOX.
3. Remove sprocket cover. See 2.31 SPROCKET COVER.

WARNING
Always disconnect the negative battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

4. Unthread fastener and remove battery negative cable (black) from battery negative (-) terminal.
5. Pull back terminal cover boot on battery positive cable (red).
6. Unthread fastener and remove battery positive cable from battery positive (+) terminal.
7. Remove battery.
8. See Figure 7-77. Disconnect positive battery cable from starter.
9. See Figure 7-78. Disconnect:
   - Wire harness ground [GRD 2].
   - Rear brake light switch connector [121].
   - BAS (bank angle sensor) connector [134].
   - Right turn signal connector [18].
   - Left turn signal connector [19].
   - License plate lamp connector [45]
   - Tail light connectors [93].
   - Ground terminals on right side tail section [GRD 1] & [GRD 3].
10. Remove fuse block and relay center from support bracket.
11. Remove the rear shock absorber assembly and reservoir. See 2.22 REAR SHOCK ABSORBER.
12. Remove fan. See 4.37 COOLING FAN.
<p>| | |</p>

**Figure 7-78. Main Harness and Electrical Connectors Under Seat**
13. Remove windscreen. See 2.40 FRONT WINDSCREEN.

14. See Figure 7-79. Disconnect:
   - Turn signal flasher connector [30].
   - Instrument module connector [39].
   - Left switch housing connector [24] and right switch housing connector [22].
   - Turn signal connectors [31].
   - Headlight connector [38].
   - Horn connectors [122].
   - Clutch switch [95] from left switch housing.
   - Front brake switch [121] from right switch housing.

15. Cut and remove cable strap (6) securing main harness to ignition switch.

16. Disconnect wiring located under sprocket cover. See 7.25 SPROCKET COVER WIRING.

17. Remove heat shrink tubing and disconnect sidestand switch [133] (1). See 7.5 STARTER INTERLOCK.

18. Remove connector from oil pressure switch [120]. Oil pressure switch is located on front of engine. See 3.10 OIL PRESSURE INDICATOR SWITCH.

19. Disconnect intake air temperature sensor [89]. See 4.35 INTAKE AIR TEMPERATURE SENSOR.

20. Disconnect throttle position sensor [88]. See 4.36 THROTTLE POSITION SENSOR.

22. Remove spark plug wires.

23. Remove any remaining cable straps and clamps securing wire harness and remove harness from front of vehicle.

24. Pull the main harness out through the rear of the frame/fuel tank assembly between the trunk pan and the rear tire.

   **NOTE**
   Using scissors jack, raise vehicle higher to gain more clearance between the trunk pan and tire.

25. Remove all push pins.
INSTALLATION

NOTE
For more information on wire harness and hose routing, see D.1 HOSE AND WIRE ROUTING.

1. Install the new harness from the rear of the vehicle working towards the front.
2. Feed front and center portion of harness between the trunk pan and tire through opening at rear of frame/fuel tank assembly.
3. Place connectors in general location of installation.
4. Secure plastic harness holder to left inside portion of frame using plastic tree fasteners.

NOTE
Fuel line is installed under engine connector portion of wire harness.

5. See Figure 7-80. Install clamp over portion of harness that leads to engine connectors. Install clamp as shown using new plastic tree fastener.

6. See Figure 7-81. Route portion of main wire harness that contains the positive battery cable (3), sprocket cover wiring (4) and transmission vent hose (2) through corner mounting tab (1) at rear of frame. Install new plastic tree fasteners.
7. See Figure 7-82. Connect:
   • Front brake switch [121] from right switch housing.
   • Clutch switch [95] from left switch housing.
   • Horn connectors [122].
   • Headlight connector [38].
   • Turn signal connectors [31].
   • Left switch housing connector [24] and right switch housing connector [22].
   • Instrument module connector [39].
   • Turn signal flasher connector [30].

8. Install cable strap (6) loosely around main harness (6) and ignition switch.

9. Connect throttle position sensor [88]. See 4.36 THROTTLE POSITION SENSOR.

10. Connect intake air temperature sensor [89]. See 4.35 INTAKE AIR TEMPERATURE SENSOR.

11. Install spark plug wires.

12. Install connector on oil pressure switch [120]. See 3.10 OIL PRESSURE INDICATOR SWITCH.

13. Install sprocket cover wiring. See 7.25 SPROCKET COVER WIRING.

14. Connect sidestand switch connector [133]. Install heat shrink tubing. Install cable strap securing sidestand switch wiring to sidestand switch bracket. See 7.5 STARTER INTERLOCK.

15. Connect fan connector [97].

16. Install fan and tighten fasteners to 12.36 in-lbs (1.4-4.1 Nm). See 4.37 COOLING FAN.

17. Install rear shock absorber assembly. See 2.22 REAR SHOCK ABSORBER.

18. Pull rear section of main harness up over trunk pan towards the rear of the vehicle and place connectors in general location of installation.

19. Install fuse block and relay center on support bracket.

20. See Figure 7-82. Connect:
   • Ground terminals on right side tail section [GRD 1] & [GRD 3].
   • Tail light connectors [93].
   • Left turn signal connector [18].
   • Right turn signal connector [18].
   • BAS (bank angle sensor) connector [134].
   • ECM connectors [10, 11].
   • Rear brake light switch connector [121].
   • Wire harness ground [GRD 2].

21. Install starter side of positive battery cable to starter.
1. Main harness
2. Main harness ground (high voltage ground wire)
3. Battery ground cable
4. Battery positive cable
5. Rear brake light switch connector [121]
6. Ground terminals (low voltage ground wires)
8. Fuse block and relay center
9. BAS (bank angle sensor) connector [134]
10. Right turn signal connector [18]
11. Left turn signal connector [19]
12. License plate lamp connector [45]
13. Tail light connectors [93]

Figure 7-83. Main Harness and Electrical Connectors Under Seat
22. See Figure 7-84. Install cable straps:
   a. Front cable strap (3) secures voltage regulator and oil pressure switch wiring.
   b. Middle cable strap (2) secures voltage regulator, oil pressure switch and cam position sensor wiring.
   c. Rear cable strap (1) secures conduit to voltage regulator wiring.
23. Verify that front forks can be turned from full left to full right lock without wire harness binding or pinching.

**WARNING**
Always connect the positive battery cable first. If the positive cable should contact ground with the negative cable installed, the resulting sparks may cause a battery explosion which could result in death or serious injury.

24. Install positive battery cable (red) to positive terminal of battery. Tighten to 72-96 in-lbs (8-11 Nm).
25. Connect negative battery cable. Tighten to 72-96 in-lbs (8-11 Nm).
26. Verify operation of all electrical components.
27. Install windscreen. See 2.40 FRONT WINDSCREEN.

**WARNING**
After installing seat, pull upward on front of seat to be sure it is locked in position. If seat is loose, it could shift during vehicle operation and startle the rider, causing loss of control which could result in death or serious injury.

28. Install seat. See 2.41 SEAT.
GENERAL

Connectors for the stator [46], voltage regulator [77], vehicle speed sensor [65], cam position sensor [14] and neutral switch [131] are located under the sprocket cover.

REMOVAL

1. Remove sprocket cover. See 2.31 SPROCKET COVER.
2. See Figure 7-85. Disconnect appropriate connector(s).

INSTALLATION

NOTE
See Figure 7-85. All wiring under sprocket cover that gets routed from sprocket area towards front of vehicle is routed behind cam cover breather hose (8).

1. Route oil pressure switch wiring (10) from main harness (6), behind cam cover vent hose (8) to oil pressure switch located on front of engine.
2. Route sidestand switch wiring (not shown) from main harness, underneath engine and to sidestand switch [133].

NOTE
Stator connector wiring is installed over oil pressure and sidestand switch wiring.

3. Connect stator connector (9).
4. See Figure 7-86. Connect cam position sensor [14] (1). Form a loop (2) as shown using wiring leading to cam position sensor.

---

Figure 7-85. Sprocket Cover Wiring

Figure 7-86. Cam Position Sensor Wiring
In next step, be sure loops in cam position sensor and neutral switch wiring are intact.

5. See Figure 7-87. Connect neutral switch connector.

6. See Figure 7-88. Form a loop (6) as shown using neutral switch wiring.

7. Use cable strap (5) to secure cam position sensor (1), cam position sensor wiring (3), neutral switch connector (4) and neutral switch connector wiring (6).

8. See Figure 7-89. Connect vehicle speed sensor connector.

9. See Figure 7-90. Connect voltage regulator connector (1). Be sure connector latch faces inward and voltage regulator wires are positioned behind other wires in harness at sprocket cover boss (2).

10. Install cable strap (3) securing vehicle speed sensor wiring to starter connector (128) wiring.

11. Install cable strap (5) securing main harness wiring.

12. Install cable strap (6) securing stator, cam position sensor and oil pressure switch wiring.

13. Add cable strap (7) to secure cam position sensor and voltage regulator wiring.
